VQ6 Series Thermal Conductivity Gas Detector Elements

To be read in conjunction with "Introduction to Pellistor Gas Sensors" and Pellistor Application Note 5 - Thermal Conductivity Sensors.

INTRODUCTION

The VQ6 series devices consist of two matched elements which are used for the detection of gases in 0 - 100% by volume concentrations using the recommended bridge circuit (see below) and the mounting arrangement shown on page 3. The VQ6M is supplied with braided leads and the VQ6MB has extended pins for fitting directly to printed circuit boards.

The elements operate on the thermal conductivity principle. The sensing element is open to the atmosphere under test and the reference element is supplied sealed in reference air. The response of the devices is dependent upon the difference between the thermal conductivity of the atmosphere under test and the reference air. When the atmosphere under test has a thermal conductivity higher than the reference air, the sensing element loses more heat to the surroundings than the reference element. This increased heat loss causes a cooling of the sensing element and a subsequent reduction in the resistance of the sensing element compared to the reference element.

The thermal conductivity of a gas mixture is dependent on temperature and the individual thermal conductivity of the constituents of the mixture. The temperature of importance is the operating temperature of the sensing element (typically a maximum of 500 °C at the recommended bridge supply voltage). The sensor can be operated at any bridge voltage up to and including the recommended bridge supply, with the sensing element therefore running at temperatures up to and including the typical maximum. The thermal conductivity of some of the more common gases relative to air is tabulated on page 2 at various temperatures. Note that when operating the sensor in a constant voltage mode the response will be non-linear to increasing concentrations of a gas.

GENERAL DATA

Electrical

The information given below relates to the VQ6 series operating in the recommended circuit shown.

| Operation (see note 1) . | | | | | | . continuous |
|-----------------------------|------|-------|---|--|-----|-------------------|
| Bridge supply | | | | | | $2.0 \pm 0.1 \ V$ |
| Bridge power consumption | | | | | | 0.75 W max |
| Typical response to methane | e in | ı air | - | | | |
| / O) | | | | | 1 (| |

| Typical response | 0 10 | , | 1011 | i a i i | 0 11 | | | | | | |
|------------------|------|---|------|---------|------|--|--|-----|-----|----|------------|

BRIDGE CIRCUIT

MARKING

Each element is identified by a unique serial number written on the can of both the sensing and reference elements. The serial number is written in red on the sensing element and black on the reference element. In addition, the sensing element carries a red circular label on the base identifying the device type.

NOTES

- 1. Operation may be under either direct flow or diffusion conditions in appropriate mountings (see page 3).
- 2. With open-circuit conditions at the bridge output.
- 3. The response time is a function of the type of mounting used.

ORDERING INFORMATION

| Order Code | Description |
|------------|---|
| VQ6 | Flexi-leg sensor with open compensator can. This device needs to have the compensator mounted in a sealed chamber filled with air or nitrogen. |
| VQ6B | PCB legged sensor with open compensator can. This device needs to have the compensator mounted in a sealed chamber filled with air or nitrogen. |
| VQ6M | Flexi-leg sensor with sealed compensator can. |
| VQ6MB | PCB legged sensor with sealed compensator can. |
