Features

- 5 kV/μs Minimum Common Mode Rejection (CMR) at $V_{CM} = 50$ V for HCPL-X601/X631, HCNW2601 and 10 kV/μs Minimum CMR at $V_{CM} = 1000$ V for HCPL-X611/X661, HCNW2611
- High Speed: 10 MBd Typical
- LSTTL/TTL Compatible
- Low Input Current
- Capability: 5 mA
- Guaranteed ac and dc Performance over Temperature: -40°C to +85°C
- Available in 8-Pin DIP, SOIC-8, Widebody Packages
- Storable Output (Single Channel Products Only)
- Safety Approval
UL Recognized - 3750 V rms for 1 minute and 5000 V rms* for 1 minute per UL1577
CSA Approved
IEC/EN/DIN EN 60747-5-2
Approved with
 $V_{IORM} = 630$ V peak for HCPL-2611 Option 060 and
 $V_{IORM} = 1414$ V peak for HCNW137/26X1
- MIL-PRF-38534 Hermetic Version Available (HCPL-56XX/66XX)

Applications

- Isolated Line Receiver
- Computer-Peripheral Interfaces
- Microprocessor System Interfaces
- Digital Isolation for A/D, D/A Conversion
- Switching Power Supply
- Instrument Input/Output Isolation
- Ground Loop Elimination
- Pulse Transformer Replacement

- Power Transistor Isolation in Motor Drives
- Isolation of High Speed Logic Systems

Description

The 6N137, HCPL-26XX/06XX/4661, HCNW137/26X1 are optically coupled gates that combine a GaAsP light emitting diode and an integrated high gain photo detector. An enable input allows the detector to be strobed. The output of the detector IC is

*5000 V rms/1 Minute rating is for HCNW137/26X1 and Option 020 (6N137, HCPL-2601/11/30/31, HCPL-4661) products only.

A 0.1 μF bypass capacitor must be connected between pins 5 and 8.

CAUTION: It is advised that normal static precautions be taken in handling and assembly of this component to prevent damage and/or degradation which may be induced by ESD.

an open collector Schottky-clamped transistor. The internal shield provides a guaranteed common mode transient immunity specification of 5,000 V/ μ s for the HCPL-X601/X631 and HCNW2601, and 10,000 V/ μ s for the HCPL-X611/X661 and HCNW2611.

This unique design provides maximum ac and dc circuit isolation while achieving TTL compatibility. The optocoupler ac and dc operational parameters are guaranteed from -40°C to +85°C allowing troublefree system performance.

The 6N137, HCPL-26XX, HCPL-06XX, HCPL-4661, HCNW137, and HCNW26X1 are suitable for high speed logic interfacing, input/output buffering, as line receivers in environments that conventional line receivers cannot tolerate and are recommended for use in extremely high ground or induced noise environments.

Notes:

1. Technical data are on separate Agilent publications.
2. 15 kV/ μ s with V_{CM} = 1 kV can be achieved using Agilent application circuit.
3. Enable is available for single channel products only, except for HCPL-193X devices.

- 020 = 5000 V rms/1 minute UL Rating Option*
- 060 = IEC/EN/DIN EN 60747-5-2 $V_{IORM} = 630$ Vpeak Option**
- 300 = Gull Wing Surface Mount Option†
- 500 = Tape and Reel Packaging Option
- XXXE = Lead Free Option

Option data sheets available. Contact Agilent sales representative or authorized distributor for information.

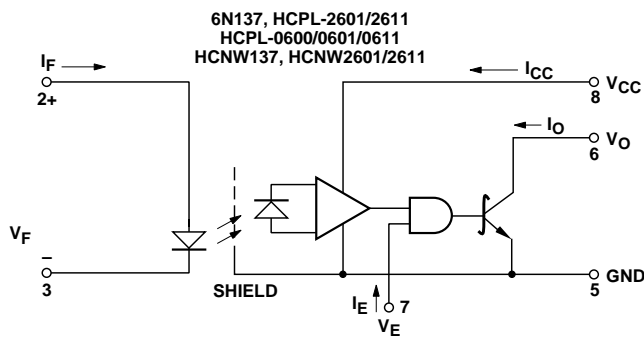

Remarks: The notation “#” is used for existing products, while (new) products launched since 15th July 2001 and lead free option will use “-”

*For 6N137, HCPL-2601/11/30/31 and HCPL-4661 (8-pin DIP products) only.

**For HCPL-2611 only. Combination of Option 020 and Option 060 is not available.

†Gull wing surface mount option applies to through hole parts only.

Schematic

USE OF A 0.1 μ F BYPASS CAPACITOR CONNECTED BETWEEN PINS 5 AND 8 IS RECOMMENDED (SEE NOTE 5).

- Peaking circuits may produce transient input currents up to 50 mA, 50 ns maximum pulse width, provided average current does not exceed 15 mA.
- Derate linearly above 80°C free-air temperature at a rate of $2.7 \text{ mW}/^\circ\text{C}$ for the SOIC-8 package.
- Bypassing of the power supply line is required, with a $0.1 \mu\text{F}$ ceramic disc capacitor adjacent to each optocoupler as illustrated in Figure 17. Total lead length between both ends of the capacitor and the isolator pins should not exceed 20 mm.
- The JEDEC registration for the 6N137 specifies a maximum I_{OH} of 250 μA . Agilent guarantees a maximum I_{OH} of 100 μA .
- The JEDEC registration for the 6N137 specifies a maximum I_{CCH} of 15 mA. Agilent guarantees a maximum I_{CCH} of 10 mA.
- The JEDEC registration for the 6N137 specifies a maximum I_{CCL} of 18 mA. Agilent guarantees a maximum I_{CCL} of 13 mA.
- The JEDEC registration for the 6N137 specifies a maximum I_{EL} of -2.0 mA . Agilent guarantees a maximum I_{EL} of -1.6 mA .
- The t_{PLH} propagation delay is measured from the 3.75 mA point on the falling edge of the input pulse to the 1.5 V point on the rising edge of the output pulse.
- The t_{PHL} propagation delay is measured from the 3.75 mA point on the rising edge of the input pulse to the 1.5 V point on the falling edge of the output pulse.
- t_{PSK} is equal to the worst case difference in t_{PHL} and/or t_{PLH} that will be seen between units at any given temperature and specified test conditions.
- See application section titled "Propagation Delay, Pulse-Width Distortion and Propagation Delay Skew" for more information.
- The t_{ELH} enable propagation delay is measured from the 1.5 V point on the falling edge of the enable input pulse to the 1.5 V point on the rising edge of the output pulse.
- The t_{EHL} enable propagation delay is measured from the 1.5 V point on the rising edge of the enable input pulse to the 1.5 V point on the falling edge of the output pulse.
- CM_H is the maximum tolerable rate of rise of the common mode voltage to assure that the output will remain in a high logic state (i.e., $V_O > 2.0 \text{ V}$).
- CM_L is the maximum tolerable rate of fall of the common mode voltage to assure that the output will remain in a low logic state (i.e., $V_O < 0.8 \text{ V}$).
- For sinusoidal voltages, $(|dV_{CM}| / dt)_{\max} = \pi f_{CM} V_{CM}(P-D)$.

Propagation Delay, Pulse-Width Distortion and Propagation Delay Skew

Propagation delay is a figure of merit which describes how quickly a logic signal propagates through a system. The propagation delay from low to high (t_{PLH}) is the amount of time required for an input signal to propagate to the output, causing the output to change from low to high. Similarly, the propagation delay from high to low (t_{PHL}) is the amount of time required for the input signal to propagate to the output causing the output to change from high to low (see Figure 8).

Pulse-width distortion (PWD) results when t_{PLH} and t_{PHL} differ in value. PWD is defined as the difference between t_{PLH} and t_{PHL} and often determines the maximum data rate capability of a transmission system. PWD can be expressed in percent by dividing the PWD (in ns) by the minimum pulse width (in ns) being transmitted. Typically, PWD on the order of 20-30% of the minimum pulse width is tolerable; the exact figure depends on the particular application (RS232, RS422, T-1, etc.).

Propagation delay skew, t_{PSK} , is an important parameter to consider in parallel data applica-

tions where synchronization of signals on parallel data lines is a concern. If the parallel data is being sent through a group of optocouplers, differences in propagation delays will cause the data to arrive at the outputs of the optocouplers at different times. If this difference in propagation delays is large enough, it will determine the maximum rate at which parallel data can be sent through the optocouplers.

Propagation delay skew is defined as the difference between the minimum and maximum propagation delays, either t_{PLH} or t_{PHL} , for any given group of optocouplers which are operating under the same conditions (i.e., the same drive current, supply voltage, output load, and operating temperature). As illustrated in Figure 19, if the inputs of a group of optocouplers are switched either ON or OFF at the same time, t_{PSK} is the difference between the shortest propagation delay, either t_{PLH} or t_{PHL} , and the longest propagation delay, either t_{PLH} or t_{PHL} .

As mentioned earlier, t_{PSK} can determine the maximum parallel data transmission rate. Figure 20 is the timing diagram of a typical parallel data application with both the clock and the data lines being sent through optocouplers. The figure shows data and clock

signals at the inputs and outputs of the optocouplers. To obtain the maximum data transmission rate, both edges of the clock signal are being used to clock the data; if only one edge were used, the clock signal would need to be twice as fast.

Propagation delay skew represents the uncertainty of where an edge might be after being sent through an optocoupler. Figure 20 shows that there will be uncertainty in both the data and the clock lines. It is important that these two areas of uncertainty not overlap, otherwise the clock signal might arrive before all of the data outputs have settled, or some of the data outputs may start to change before the clock signal has arrived. From these considerations, the absolute minimum pulse width that can be sent through optocouplers in a parallel application is twice t_{PSK} . A cautious design should use a slightly longer pulse width to ensure that any additional uncertainty in the rest of the circuit does not cause a problem.

The t_{PSK} specified optocouplers offer the advantages of guaranteed specifications for propagation delays, pulsewidth distortion and propagation delay skew over the recommended temperature, input current, and power supply ranges.
