

VIDEO SUPER IMPOSER WITH AFC

■ GENERAL DESCRIPTION

The **NJM2217** has functions of character and background superimposition to video signal and consists of synchronous separation circuit, vertical synchronous reproducing circuit, video switch and AFC circuit. Built-in AFC circuit makes the **NJM2217** stable to noise and disorder of synchronous signal and takes off character disorder on Display Broun tube.

■ FEATURES

- Operating Voltage (+4V to +6V)
- 2 video signal input terminals
- Internal synchronous separation Circuit and internal horizontal synchronous reproduce circuit. Can make trigger signal to character generator.
- Stable horizontal synchronous signal by build-in AFC circuit.
- Package Outline

SDIP22, DMP24

Bipolar Technology

9/100

NJM2217M

NJM2217L

■ PACKAGE OUTLINE

■ RECOMMENDED OPERATING CONDITION

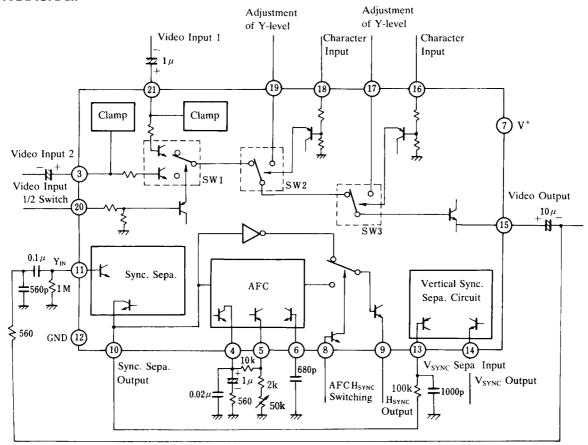

Operating Voltage

4V to 6V

■ APPLICATION

• VCR, Video Camera, Other Video Equipment

■ BLOCK DIAGRAM

■ ABSOLUTE MAXIMUM RATINGS

(T_a=25°C)

PARAMETER	SYMBOL	RATINGS	UNIT
Supply Voltage	V ⁺	7	V
Power Dissipation	P_D	(SDIP22) 700 (DMP24) 700	mW
Operating Temperature Range	T _{opr}	-20 to +75	°C
Storage Temperature Range	T _{stg}	-40 to +125	°C

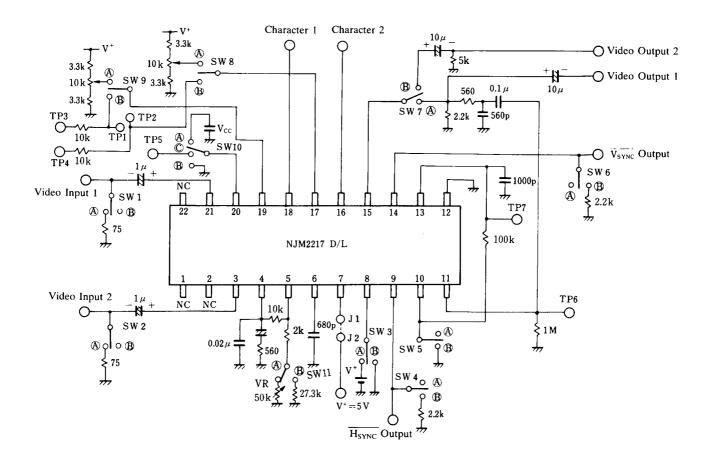

■ ELECTRICAL CHARACTERISTICS

Differential Phase	DP	10 STEP Stair wave 2.2V _{P-P} R _L =	=5kΩ	-	0.5	3.0	deg
Sync. Separation Level	V _{SEPA}	Level from Sync. top		90	120	150	mV

⁽Note 1): AFC Input is composite synchronous signal.

⁽Note 2): Time lag between horizontal synchronous signal with AFC and without AFC. (The timing gap at 9 pin output, in the case of 8 pin = high, and 8 pin = low.)

■ TEST CIRCUIT

■ AFC CIRCUIT CONFIGURATION & ITS FEATURE

The **NJM2217** has AFC function of horizontal synchronous signal applied to character generator. AFC circuit of the **NJM2217** is like PLL circuit and operates as band pass filter. If pulse Noise is mixed to the input horizontal synchronous signal of AFC circuit, it does not appear at AFC output when AFC circuit is on the lock condition. Because if noise appeared at output of phase comparator, low pass filter takes off it and it is not carried to VCO circuit. (Fig.1)

Fig.2 shows block diagram of AFC circuit.

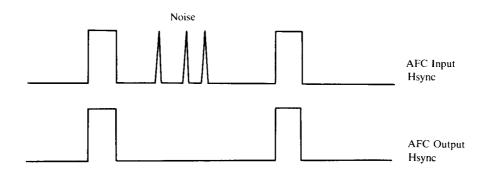

Fig.1 Input and Output of AFC circuit with Mixed Noise

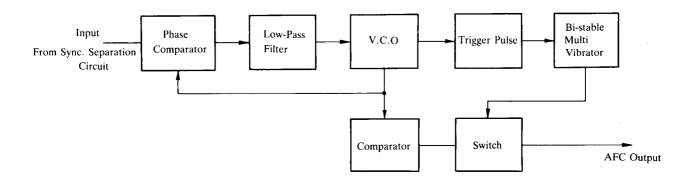

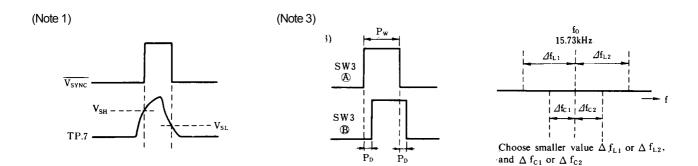

Fig.2 AFC Circuit Configuration

■ TEST CIRCUIT CONDITION

PARAMETER	INPUT	OUTPUT	SW1	SW2	SW3	SW4	SW5	SW6	SW7	SW8	SW9	SW10	APPENDIX

21	VIDEO-IN 1	Video signal input pin. Sink chip clamp at 2.1V.	(21) V+
22	NC	No connection	

■ PRINCIPLES OF OPERATION

1) Video Switch

The **NJM2217** has three video switches. One of them is used to select one video signal from two input video signal, and two others are used for super-imposer of character and background. Switching operation is done by putting DC voltage in to Pin 16, 18 or 20, and its threshold voltage is 1.4V typical.

The **NJM2217** has inside clamp circuit, and input video signal of Pin 3 or Pin 21 is sink-chip-clamped at 2.1V. Output circuit is emitter follower and drives to $5k\Omega$ load.

2) Synchronous Separation Circuit

It separates composit synchronous signal from video signal, and this composit synchronous signal is applied to AFC circuit. And finally you can get horizontal synchronous signal (H_{sync}) from AFC circuit. Operation of synchronous separation is possible if signal level from synchronous signal top is more than 120mV_{P-P}.

3) Vertical Synchronous Reproduce Circuit

Composit signal from synchronous separation circuit is applied to integrator and triangle wave from it goes to schmitt trigger circuit which reproduces vertical synchronous signal. Output circuit is emitter follower and output voltage is $4V_{P-P}$ at $2k\Omega$ load.

4) AFC Circuit

Fig.3 shows block diagram of AFC circuit. Voltage proportional to phase difference between horizontal synchronous signal putted in to phase comparator and triangular wave from VCO is smoothed by low pass filter and is put in to VCO. This VCO frequency is changed to direction of coincidence with input frequency. Triangular wave from VCO output flows through window comparator and 5µs width of output pulse signal which is same width to H_{sync} appears.

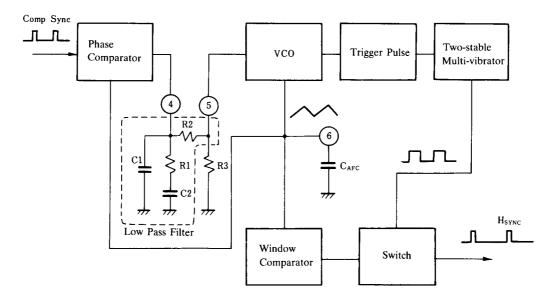

Fig.3 AFC Circuit Block

a) Free-Run Frequency

Free-run frequency depends on resistor R3 between Pin 5 and ground, and capacitor C_{AFC} between Pin 6 and ground.

$$f_{FREE} = 1/(3.3 \cdot C_{AFC} \cdot R3)[Hz](1)$$

b) Parameter of Low Pass Filter

Impedance vs. frequency characteristic from Pin 4 to Pin 5 is shown on Fig.4.

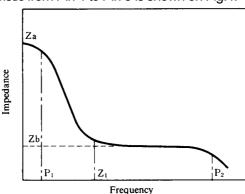

Fig.4 Low Pass Filter Impedance Characteristics

 P_1 , P_2 , Z_1 , Z_a , Z_b are shown below.

 $\begin{array}{lll} P_1 = 1/\{2\pi C_2 (R_2 + R_3)\} & [Hz] & (2) \\ P_2 = 1/(2\pi C_1 \cdot R_1) & [Hz] & (3) \\ Z_1 = 1/(2\pi C_2 \cdot R_1) & [Hz] & (4) \\ Z_a = R_2 + R_3 & (5) \\ Z_b = R_1 & & & \end{array}$

 Z_a is decided by R_2 and R_3 is decided by free run frequency and so Z_a is generally decided by R_2 . Value of P_1 , P_2 , Z_1 , Z_a , Z_b affects lock range, capture range, frequency fluctuations of AFC output and others. It is preferable that P_2 is 15kHz and Z_1 is 60Hz. When Z_b becomes large, lock and caputure range becomes wide but fluctuations of AFC output frequency will increase. Large Z_a decreases fluctuations.

■ DESIGN EXAMPLE OF L.P. FILTER

P₁=2Hz

P₂=16kHz

Z₁=60Hz

 $Z_a=40k\Omega$

 $Z_b=1k\Omega$

C_{AFC}=680pF

Each value of low pass filter is caluculated below. If decided free fun frequency to 15.74kHz, and from equation (1).

R₃=28.4kΩ

 Z_a =40k Ω and equation (5),

 $R_2=12k\Omega$

From equation (2),

 $C_2 = 2.1 \mu F$

From equation (4),

 $R_1=1.3k\Omega$

From equation (3),

C₁=7700pF

Measured value at R₁=1k Ω , R₂=10k Ω , C₁=1 μ F, C₂=2.2 μ F

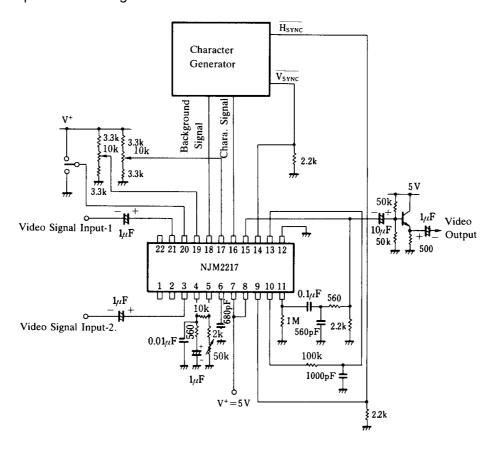

Lock range=3.3kHz

Capture range=1.7kHz

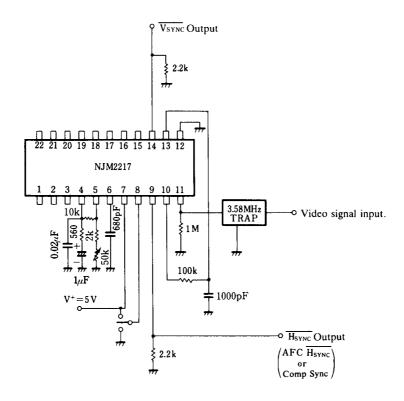

(Note) Temperature characteristics of free run frequency, lock and capture range are deeply affected by temperature coefficient of C_{AFC} and each device of low pass filter, and so it is preferable using low temperature coefficient device. If temperature coefficient of C_{AFC} and R_3 is $0ppm/^{\circ}C$ temperature coefficient of free run frequency is almost $0ppm/^{\circ}C$. (Ref. to typical characteristics graph.)

■ TYPICAL APPLICATION

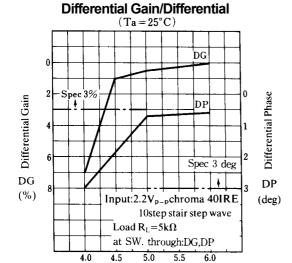

Character superimposer on video signal.

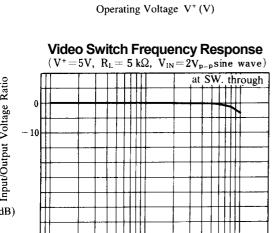

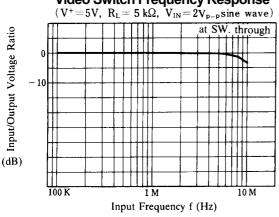

Synchronous separation of video signal.

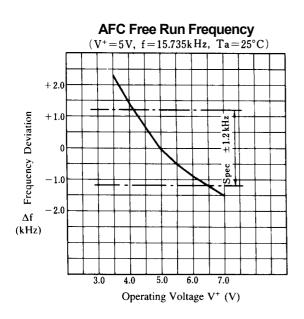

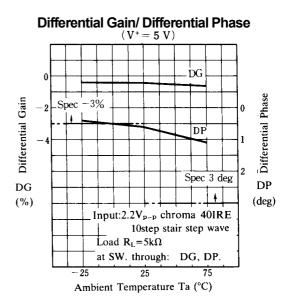

■ TYPICAL CHARACTERISTICS

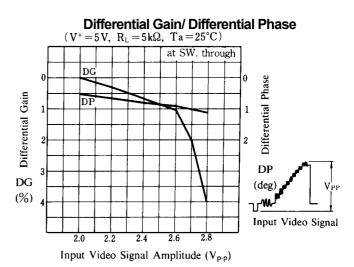

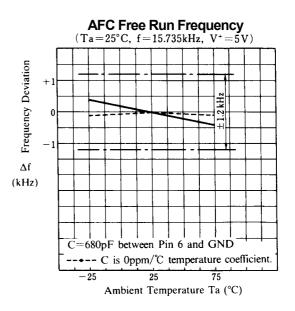

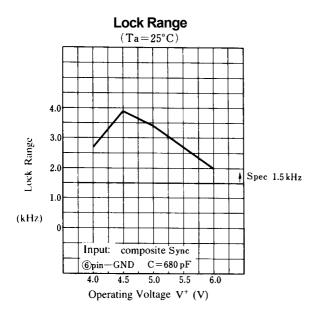

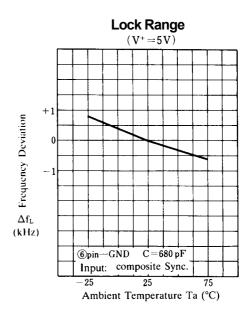

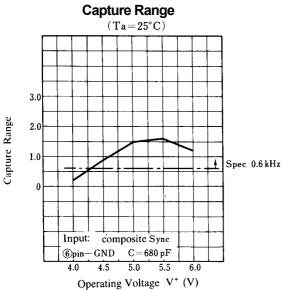

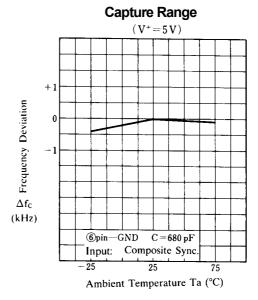

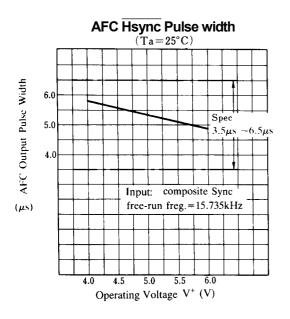

■ TYPICAL CHARACTERISTICS

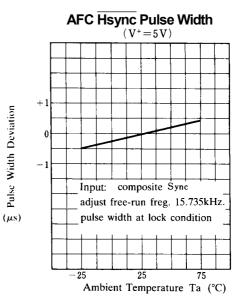

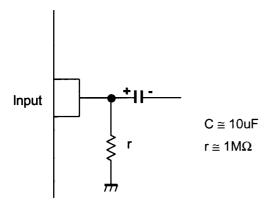

■ APPLICATION

This IC requires $1M\Omega$ resistance between INPUT and GND pin for clamp type input since the minute current causes an unstable pin voltage.
