

38-common x 132-segment+1-icon common Bitmap LCD Driver

■ GENERAL DESCRIPTION

The **NJU6674** is a Bitmap LCD Driver to display graphics or characters.

It contains 5,148 bits display data RAM, Microprocessor interface circuits, instruction decoder, 38-common and 132-segment +1-icon common drivers.

The bit image display data is transferred to the display data RAM by serial or 8-bit parallel interface.

39 x 132 dots graphics or 10-character 3-line by 12 x 13 dot character with icon are displayed by **NJU6674** itself.

The wide operating voltage from 2.4V to 3.3V and low operating current are suitable for small sized battery operated items.

■ PACKAGE

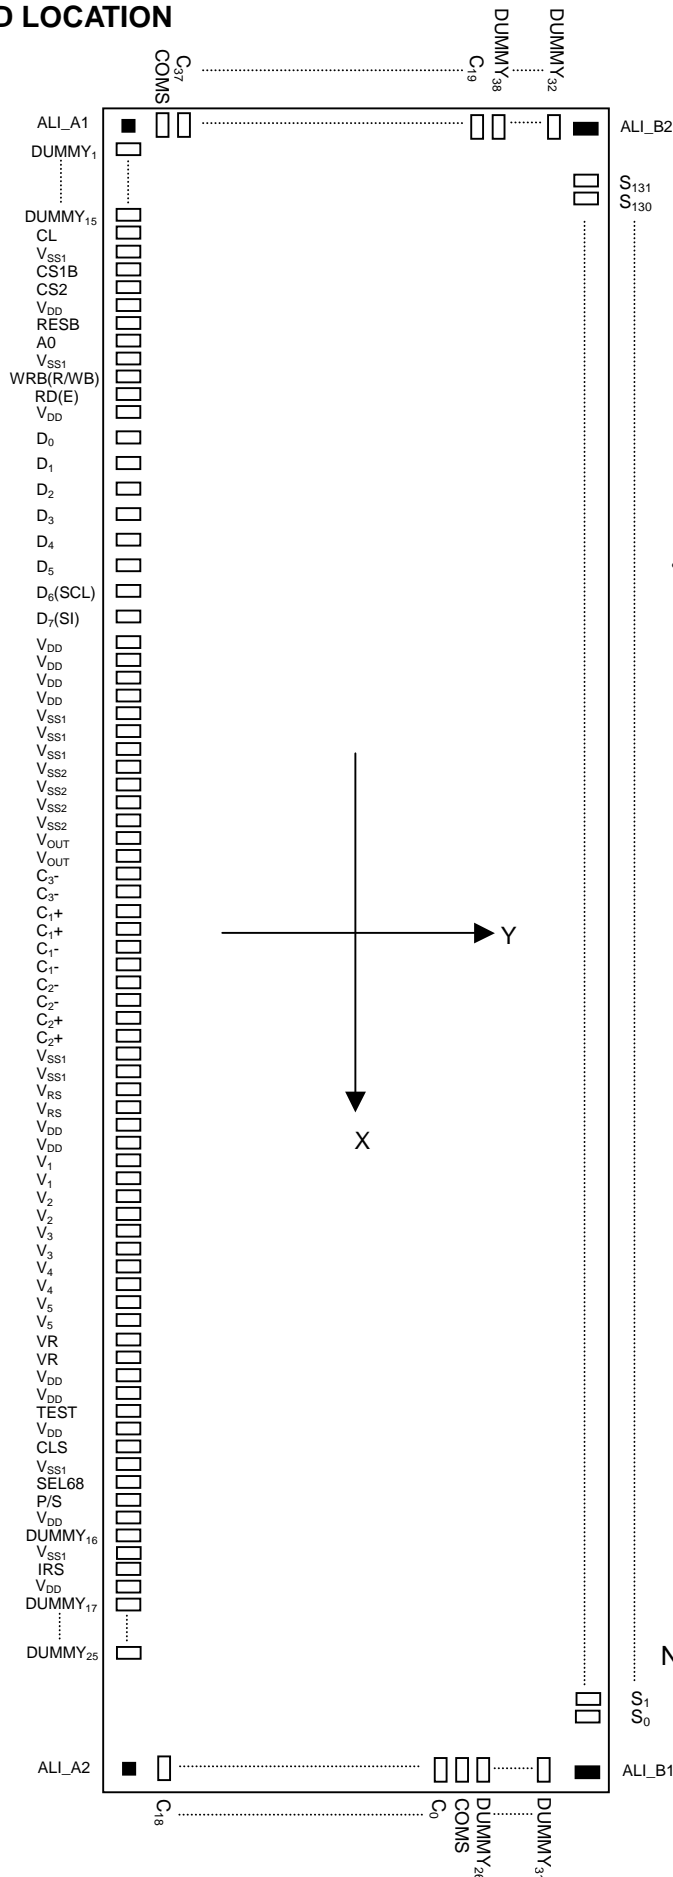

NJU6674CJ

■ FEATURES

- Direct Correspondence between Display Data RAM and LCD Pixel
- Display Data RAM : 5,148-bit
- LCD Drivers : 132-seg, 38-com+1-icon com
- Bias select 1/5 bias or 1/6 bias
- Direct interface with 68 and 80 type MPU
- Serial interface (SI, SCL, A0, CS₁B, CS₂)
- Useful Instruction Set
 - Display ON/OFF ,Display Start Line Set, Page Address Set, Column Address Set, Status Read, Display Data Write, Display Data Read, ADC Select, Inverse Display, Entire display ON/OFF, Bias Select, Read Modify Write, End, Reset, Power control set, Internal resistor ratio set, EVR Register Set, EVR Mode Set, Power saving
- Power Supply Circuits for LCD incorporated
 - Step up circuit (x2, x3, x4), Regulator, Voltage Follower x4, V_s level is adjusted by internal bleeder resistance Precision Electrical Variable Resistance (64-steps)
- Bias Stabilization Capacitor less
- Low power consumption
- Operating Voltage (All the voltages are based on V_{DD}=0V.)
 - Logic Operating -2.4 to -3.3V
 - Voltage Booster Operating Voltage -2.4 to -3.3 V
 - LCD Driving voltage -5.0 to -10.0V
- Rectangle outlook for COG
- Package outline: Bump-chip
- C-MOS Technology (Substrate: N)

NJU6674

■ PAD LOCATION

Chip Center :X=0μm, Y=0μm
 Chip Size :X=10.38mm, Y= 2.51mm
 Chip Thickness :400μm±30μm
 Bump Size :78.16μm x 48.10μm
 PAD Pitch :72μm(Min)
 Bump Height :17.5μm(Typ)
 Bump Material :Au
 Voltage Boosting Polarity :Negative Voltage(V_{DD} common)
 Substrate :N

• Alignment marks

Note) Alignment Marks are not contains window.

■ Functional description

(1) Block circuits description

(1-1) Busy Flag (BF)

During internal operation, the LSI is being busy and can't accept any instructions except "status read". The BF data is output through D₇ terminal by the "status read" instruction.

When the cycle time (tcyc) mentioned in the "AC characteristics" is satisfied, the BF check isn't required after each instruction, so that MPU processing performance can be improved.

(1-2) Initial display line register

The initial display line register assigns a DDRAM line address, which corresponds, to COM₀ by "initial display line set" instruction. It is used for not only normal display but also vertical display scrolling and page switching without changing the contents of the DDRAM.

However, the 39th address for icon display can't be assigned for initial display line address.

(1-3) Line counter

The line counter provides a DDRAM line address. It initializes its contents at the switching of frame timing signal (FR), and also counts-up in synchronization with common timing signal.

(1-4) Column address counter

The column address counter is an 8-bit preset counter, which provides a DDRAM column address, and it is independent of below-mentioned page address register.

It will increment (+1) the column address whenever "display data read" or "display data write" instructions are issued. However, the counter will be locked when no-existing address above (84)H are addressed. The count-lock will be able to be released by the "column address set" instruction again. The counter can invert the correspondence between the column address and segment driver direction by means of "ADC set" instruction.

(1-5) Page address register

The page address register provides a DDRAM page address.

The page address "1 to 3" should be used the D₀, D₁, D₂, D₃, D₄, D₅, D₆, D₇ are valid.

The page address "4" should be used the only D₀, D₁, D₂, D₃, D₄, D₅ are valid.

The last page address "5" should be used for icon display because the only D₀ is valid.

(1-6) Display data RAM (DDRAM)

The DDRAM contains 5,148-bit, and stores display data, which are 1-to-1 correspondents to LCD panel pixels.

When normal display mode, the display data "1" turns on and "0" turns off LCD pixels. When inverse display mode, "1" turns off and "0" turns on.

Page Address (D ₂ ,D ₁ ,D ₀)	Data	Display Pattern	Line Address	Common Driver

Segment Drivers	S ₀	S ₁	S ₂	S ₃	S ₄	S ₅	S ₁₃₀	S ₁₃₁
-----------------	----------------	----------------	----------------	----------------	----------------	----------------	-------	------------------	------------------

*: COMM is independent of the "Initial display line set" instruction and always corresponds to the 39th line.

Fig.1 Display data RAM (DDRAM) Map

(1-7) Common direction register

The common direction register specifies common driver's scanning direction.

Table 1.

		Common Drivers			
PAD No.		117	99	284	266
Pin name		C ₀	C ₁₈	C ₃₇	C ₁₉
Common direction select(D ₃)	"L"	COM ₀ → COM ₁₈		COM ₃₇ ← COM ₁₉	
	"H"	COM ₃₇ ← COM ₁₉		COM ₀ → COM ₁₈	

The duty ratio setting and output assignment register are so controlled to operate independently that duty ratio setting required to corresponding duty ratio for output assignment.

(1-8) Reset Circuit

The reset circuit initializes the LSI to the following status by using of the reset signal into the RESB terminal.

- Reset status using the RES terminal:
 1. Display off
 2. Normal Display (Non-inverse display)
 3. ADC select : Normal mode (D₀=0)
 4. Power control register clear : D₂, D₁, D₀="0, 0, 0"
 5. Serial interface register clear
 6. LCD bias select : D₀="0"(1/6 bias)
 7. Entire display off : D₀="0" (Normal mode)
 8. Read modify write off
 9. Initial display line address : 00_H
 10. Column address : 00_H
 11. Page address : 0 page
 12. Common direction register : Normal mode (D₃=0)
 13. V₅ level is adjusted by external bleeder resistance : D₂, D₁, D₀="1, 0, 0"
 14. EVR mode off and EVR register : D₅, D₄, D₃, D₂, D₁, D₀="1, 0, 0, 0, 0, 0"

The RESB terminal should be connected to MPU's reset terminal, and the reset operation should be executed at the same timing of the MPU reset.

As described in the "**DC characteristics**", it is necessary to input 10us(min.) or over "L" level signal into the RESB terminal in order to carry out the reset operation. The LSI will return to normal operation after about 1.0us(max.) from the rising edge of the rest signal.

In case of using external power supply for LCD driving voltage, the RESB terminal is required to be being "L" level when the external power supply is turned-on.

The "Reset" instruction in Table.4 can't be substituted for the reset operation by using of the RESB terminal. It executes above-mentioned only 8 to 14 items.

LCD driving circuits

(a) Common and segment drivers

LCD drivers consist of 38-common drivers, 132-segment drivers and 1-icon-common driver.

As shown in "LCD driving waveform", LCD driving waveforms are generated by the combination of display data, common timing signal and internal FR timing signal.

(b) Display data latch circuit

The display data latch circuit temporarily stores 132-bit display data transferred from the DDRAM in the synchronization with the common timing signal, and then it transfers these stored data to the segment drivers.

"Display on/off", "inverse display on/off" and "entire display on/off" instructions control only the contents of this latch circuit, they can't change the contents of the DDRAM.

In addition, the LCD display isn't affected by the DDRAM accesses during its displaying because the data read-out timing from this latch circuit to the segment drivers is independent of accessing timing to the DDRAM.

(c) Line counter and latch signal or latch Circuits

The clock line counter and latch signal to the latch circuits are generated from the internal display clock (CL). The line address of display data RAM is renewed synchronizing with display clock (CL).

132bits display data are latched in display latch circuits synchronizing with display clock, and then output to the LCD driving circuits. The display data transfer to the LCD driving circuits is executed independently with RAM access by the MPU.

(d) Display timing generator

The display timing generates the timing signal for the display system bay combination of the master clock CL and driving signal FR (refer to Fig.2) The frame signal FR and LCD alternative signal generate LCD driving waveform on the two frame alternative driving method.

(e) Common timing generation

The common timing is generated by display clock CL (refer to Fig.2)

Fig.2 Waveform of Display Timing

(f) Oscillator

This is the low power consumption CR oscillator which provides the display clock and voltage converter timing clock. Either external or internal Oscillator can be selected by setting the CLS terminal to "L" or "H" as shown in below.

CLS="L" : External Oscillator

CLS="H" : Internal Oscillator

When the internal oscillator is used, the CL terminal fixed to "H" or "L".

When the external oscillator is used, the CL terminal into display clock.

(g) Internal power circuits

The internal power circuits are composed of x4 boost voltage converter, output voltage regulator including 64-step EVR and voltage followers.

The optimum values of the external passive components for the internal power circuits, such as capacitors for V₁ to V₅ terminals and feed back resistors for VR terminal, depend on LCD panel size. Therefore, it is necessary to evaluate the actual LCD module with these external components in order to determine the optimum values.

Each portion of the internal power circuits is controlled by "power control set" instruction as shown in Table.2. In addition, the combination of power supply circuits is described in Table.3.

Table.2 Power control set

Bits	Portions	Status	
D ₂	Voltage converter	1 :On	0: Off
D ₁	Voltage regulator	1 :On	0: Off
D ₀	Voltage followers	1 :On	0: Off

Table.3 Power supply combinations

Status	D ₂	D ₁	D ₀	Voltage converter	Voltage regulator	Voltage followers	External voltage	Capacitor terminals
Using all internal power circuits	1	1	1	On	On	On	V _{SS2}	Use
Using voltage regulator and Voltage followers	0	1	1	Off	On	On	V _{OUT} , V _{SS2}	Open
Using voltage followers	0	0	1	Off	Off	On	V _{OUT} , V ₅ , V _{SS2}	Open
Using only external power supply	0	0	0	Off	Off	Off	V _{OUT} , V ₁ to V ₅	Open

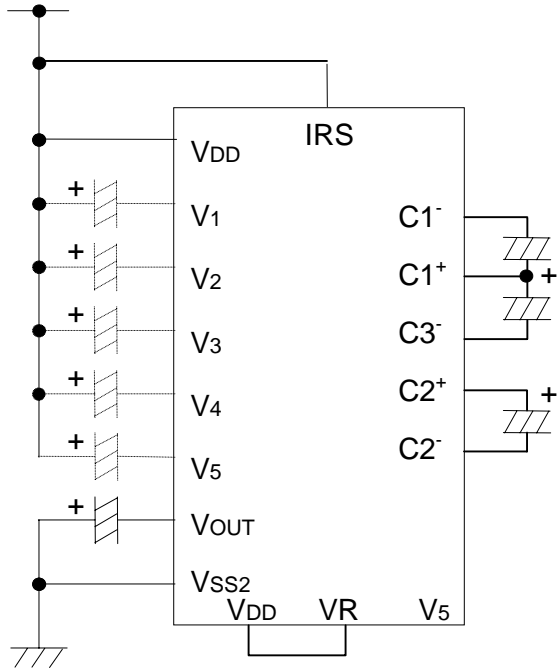

Note1) Capacitor input terminals: C1+, C1-, C2+, C2-, C3-

Note2) Do not use other combinations except examples in Table.3.

Note3) Connect decoupling capacitors on V₁ to V₅ terminals whenever using the voltage followers.

- Power Supply applications
- Power Control Instruction
- D₂ : Boost Circuit
- D₁ : Voltage Regulator
- D₀ : Voltage Follower

(1) Internal power supply Example.
 V_s level is adjusted by internal bleeder resistance (IRS="H")
 All of the Internal Booster, Voltage Regulator, Voltage Follower using. (D₂,D₁,D₀) = (1,1,1)

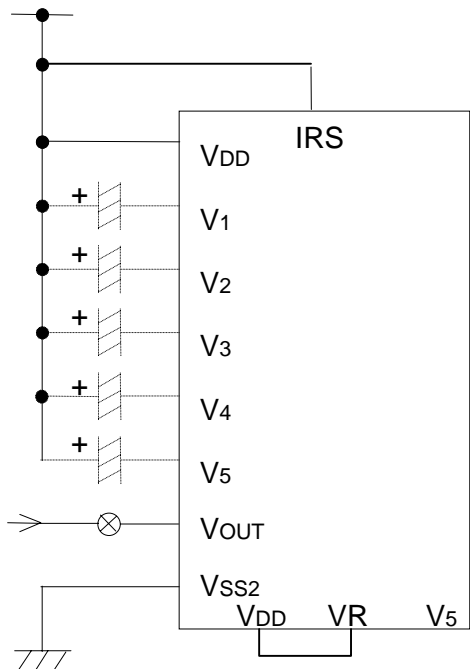

(2) Internal power supply Example.
 V_s level is adjusted by internal bleeder resistance (IRS="L")
 All of the Internal Booster, Voltage Regulator, Voltage Follower using. (D₂,D₁,D₀) = (1,1,1)

* ⊗ : Bias capacitors are selected depending on the LCD panel.
 The evaluation in various display patterns should be experimented in the application.

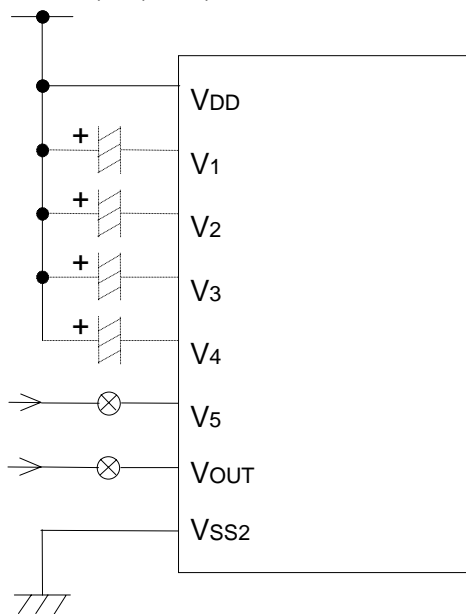

(3) Only V_{OUT} Supply from outside Example.
 V_5 level is adjusted by internal bleeder
 resistance (IRS="H")
 Internal Voltage Regulator,
 Voltage Follower using.
 $(D_2, D_1, D_0) = (0, 1, 1)$

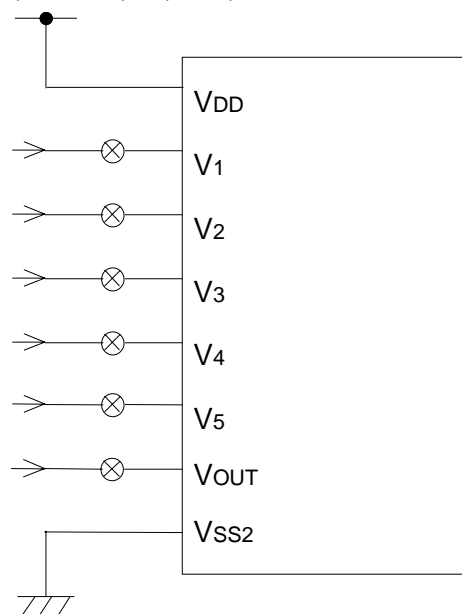

(4) Only V_{OUT} Supply from outside Example.
 V_5 level is adjusted by internal bleeder
 resistance (IRS="L")
 Internal Voltage Regulator,
 Voltage Follower using.
 $(D_2, D_1, D_0) = (0, 1, 1)$

(5) V_{OUT} and V_5 Supply from outside Example.
 Internal Voltage Follower using.
 $(D_2, D_1, D_0) = (0, 0, 1)$

(6) External Power Supply Example.
 All of V_1 to V_5 and V_{OUT} supply from outside
 $(D_2, D_1, D_0) = (0, 0, 0)$

- ⊗ : These switches should be open during the power save mode.
- ⊗ : *Bias capacitors are selected depending on the LCD panel.
 The evaluation in various display patterns should be experimented in the application.

■ INSTRUCTION SET

The NJU6674 distinguishes the data on the data bus D₇ to D₀ as an instruction by combination of A0, RDB(E), WRB(R/W) signals. The decoding of the instruction and execution performs with only high speed internal timing without relation to the external clock. Therefore, no busy flag check required normally. In case of the serial interface, the data input as MSB(D₇) first serially. Table.4 shows the instruction codes of the NJU6674.

Table.4 Instruction table

Instruction		Instruction Code											Description
		A0	RDB	WRB	D ₇	D ₆	D ₅	D ₄	D ₃	D ₂	D ₁	D ₀	
(a)	Display ON/OFF	0	1	0	1	0	1	0	1	1	1	0/1	LCD Display ON/OFF D ₀ =0:OFF D ₀ =1:ON

(*Don't Care)

(2) Instruction description

(a) Display On/Off

The "Display ON/OFF" instruction is used to control the display ON or OFF without changing the display data in the DDRAM.

All of the COM terminals at the time of "Display OFF" and SEG terminals are set to V_{DD} level.

A0	RDB	WRB	D ₇	D ₆	D ₅	D ₄	D ₃	D ₂	D ₁	D ₀
0	1	0	1	0	1	0	1	1	1	D

D 0: Display Off
1: Display On

(b) Initial display line set

This instruction specifies the DDRAM line address which corresponds to the COM₀ position.

By means of repeating this instruction, the initial display line address will be dynamically changed; it means smooth display scrolling will be enabled.

A0	RDB	WRB	D ₇	D ₆	D ₅	D ₄	D ₃	D ₂	D ₁	D ₀
0	1	0	0	1	A ₅	A ₄	A ₃	A ₂	A ₁	A ₀

A ₅	A ₄	A ₃	A ₂	A ₁	A ₀	Line address (HEX)
0	0	0	0	0	0	00
0	0	0	0	0	1	01
:	:	:	:	:	:	:
:	:	:	:	:	:	:
1	0	0	1	0	1	25

(c) Page address set

In order to access to the DDRAM for writing or reading display data, both "page address set" and "column address set" instructions are required before accessing.

The last page address "5" should be used for icon display because the only D₀ is valid.

A0	RDB	WRB	D ₇	D ₆	D ₅	D ₄	D ₃	D ₂	D ₁	D ₀	
0	1	0	1	0	1	1	*	A ₂	A ₁	A ₀	(*: Don't Care)

A ₂	A ₁	A ₀	Page
0	0	0	0
0	0	1	1
0	1	0	2
0	1	1	3
1	0	0	4
1	0	1	5

(d) Column address set

As above-mentioned, in order to access to the DDRAM for writing or reading display data, it is necessary to execute both “page address set” and “column address set” before accessing. The 8-bit column address data will be valid when both upper 4-bit and lower 4-bit data are set into the column address register.

Once the column address is set, it will automatically increment (+1) whenever the DDRAM will be accessed, so that the DDRAM will be able to be continuously accessed without “column address set” instruction.

The column address will stop increment and the page address will not be changed when the last address (83)H is addressed.

A0	RDB	WRB	D ₇	D ₆	D ₅	D ₄	D ₃	D ₂	D ₁	D ₀	
0	1	0	0	0	0	1	A ₇	A ₆	A ₅	A ₄	Upper 4-bit
0	1	0	0	0	0	0	A ₃	A ₂	A ₁	A ₀	Lower 4-bit

A ₇	A ₆	A ₅	A ₄	A ₃	A ₂	A ₁	A ₀	Column address (HEX)
0	0	0	0	0	0	0	0	00
0	0	0	0	0	0	0	1	01
⋮	⋮	⋮	⋮	⋮	⋮	⋮	⋮	⋮
⋮	⋮	⋮	⋮	⋮	⋮	⋮	⋮	⋮
1	0	0	0	0	0	1	1	83

(e) Status read

This instruction reads out the internal status regarding “busy flag”, “ADC select”, “display on/off” and “reset”.

A0	RDB	WRB	D ₇	D ₆	D ₅	D ₄	D ₃	D ₂	D ₁	D ₀
0	0	1	BUSY	ADC	ON/OFF	RESET	0	0	0	0

BUSY: When D₇ is “1”, the LSI is being busy and can’t accept any instructions.

ADC: It shows the correspondence between the column address and segment drivers.

When D₆ is “0”, the column address (131-n) corresponds to segment driver n.

When D₆ is “1”, the column address (n) corresponds to segment driver n.

Please be careful that read out data is opposite of “ADC select” instruction data.

ON/OFF: It shows display on or off status.

When D₅ is “0”, the LSI is in display-on status.

When D₅ is “1”, the LSI is in display-off status.

Please be careful that read out data is opposite of “Display On/Off” instruction data.

RESET: It shows reset status.

When D₄ is “0”, the LSI is in normal operation.

When D₄ is “1”, the LSI is during reset operation.

(f) Display data write

This instruction writes display data into the selected column address on the DDRAM.

The column address automatically increments (+1) whenever the display data is written by this instruction, so that this instruction can be continuously issued without “column address set” instruction.

A0	RDB	WRB	D ₇	D ₆	D ₅	D ₄	D ₃	D ₂	D ₁	D ₀
1	1	0	Write Data							

(g) Display data read

This instruction reads out the display data stored in the selected column address on the DDRAM. The column address automatically increments (+1) whenever the display data is read out by this instruction, so that this instruction can be continuously issued without "column address set" instruction. After the "column address set" instruction, a dummy read will be required, please refer to the (4-5). In case of using serial interface mode, this instruction can't be used.

A0	RDB	WRB	D ₇	D ₆	D ₅	D ₄	D ₃	D ₂	D ₁	D ₀
1	0	1	Read Data							

(h) ADC select

This instruction selects segment driver direction. The correspondence between the column address and segment driver direction is shown in Fig.1. Segment Driver Output order is inverse, when this instruction executes, therefore, the placement NJU6674 against the LCD panel becomes easy.

A0	RDB	WRB	D ₇	D ₆	D ₅	D ₄	D ₃	D ₂	D ₁	D ₀
0	1	0	1	0	1	0	0	0	0	D

D 0: Clockwise Output(Normal)
1: Counterclockwise Output(Inverse)

(i) Inverse display On/Off

This instruction inverses the status of turn-on or turn-off of entire LCD pixels. It doesn't change the contents of the DDRAM.

A0	RDB	WRB	D ₇	D ₆	D ₅	D ₄	D ₃	D ₂	D ₁	D ₀
0	1	0	1	0	1	0	0	1	1	D

D 0: Normal RAM data "1" correspond to "On"
1: Inverse RAM data "0" correspond to "On"

(j) Entire display On/Off

This instruction turns on entire LCD pixels regardless the contents of the DDRAM. It doesn't change the contents of DDRAM. This instruction executed prior to the "Normal or Inverse display On/Off Set" Instruction.

A0	RDB	WRB	D ₇	D ₆	D ₅	D ₄	D ₃	D ₂	D ₁	D ₀
0	1	0	1	0	1	0	0	1	0	D

D 0: Normal Display
1: Whole Display turns On

When the "Entire display On" instruction is executed at Display Off states, the NJU6674 operates in Power Save Mode. (Refer "Power Save Mode")

(k) LCD bias set

This instruction selects LCD bias value.

A0	RDB	WRB	D ₇	D ₆	D ₅	D ₄	D ₃	D ₂	D ₁	D ₀
0	1	0	1	0	1	0	0	0	1	D

D 0: 1/6 bias
1: 1/5 bias

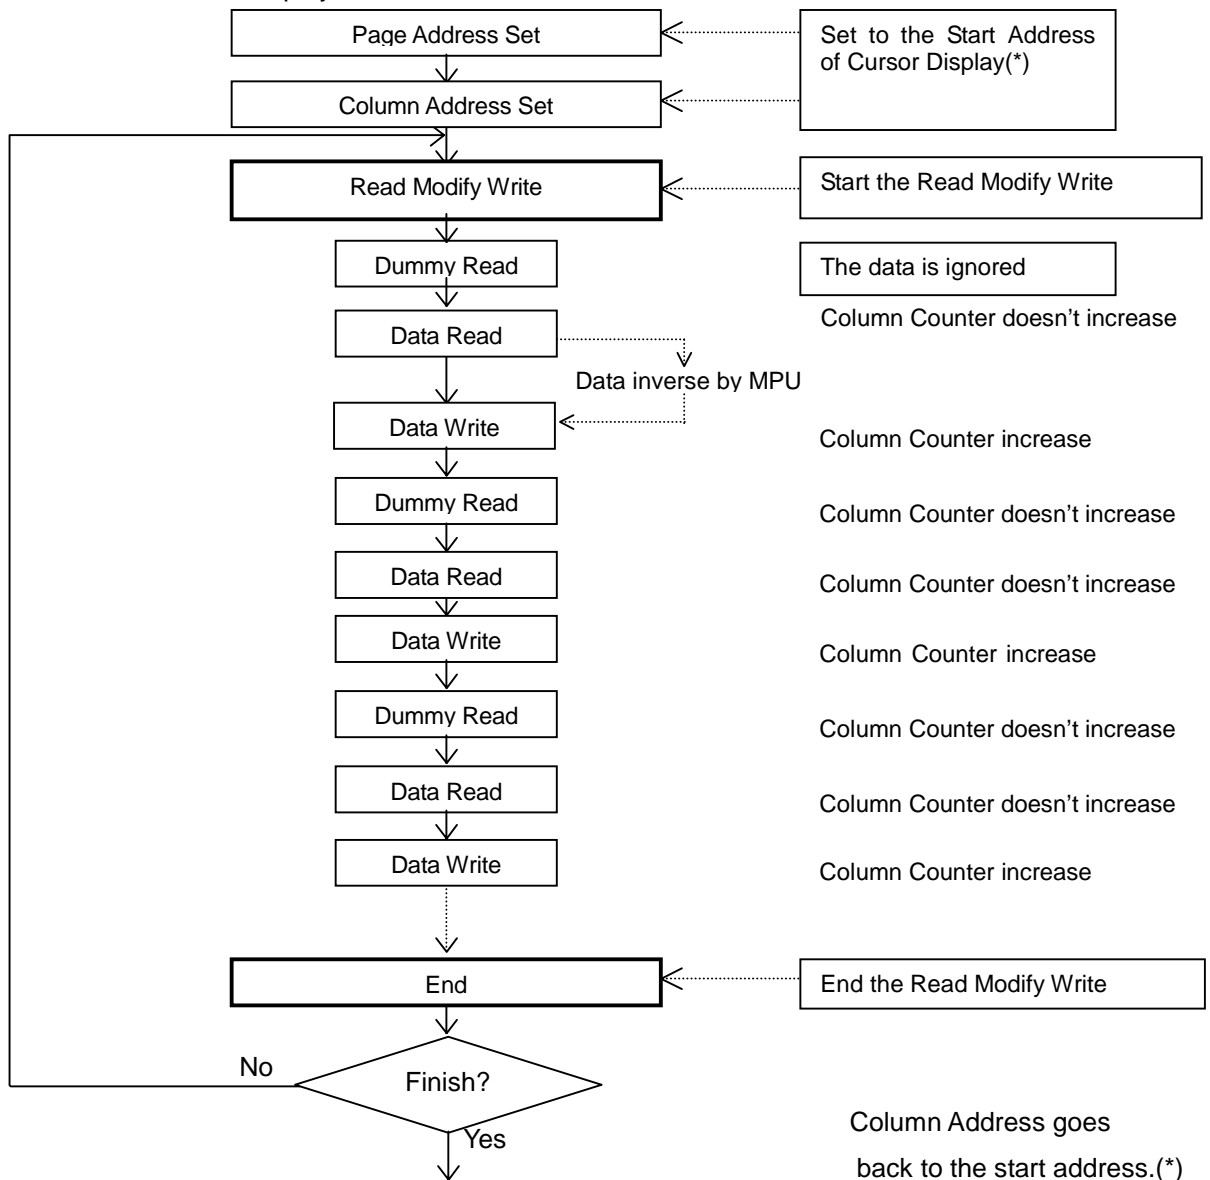

(l) Read modify write

This instruction sets the Read Modify Write controlling the Column Address increment. In this mode, Column Address only increments when execute the display data "Write" instruction; but no change when the display data "Read" Instruction. This states is continued until the End instruction(m) execution. When the End instruction is executed, the Column Address goes back to the start address before the execution of this "Read Modify Write" instruction. This function reduces the load of MPU for repeating display data change of the fixed area.

A0	RDB	WRB	D ₇	D ₆	D ₅	D ₄	D ₃	D ₂	D ₁	D ₀
0	1	0	1	1	1	0	0	0	0	0

*) In this "Read Modify Write" mode, out of display data "Read"/"Write", any instructions except "Column Address Set" can be executed.

● The sequence of cursor blink display

(m) End

The “end” instruction cancels the read modify write mode and makes the column address return to the initial value just before “read modify write” is started.

(n) Reset

This instruction reset the LSI to the following status, however it doesn't change the contents of the DDRAM. Please be careful that it can't be substituted for the reset operation by using of the RESB terminal.

Reset status by “reset” instruction:

- 1: Read modify write off
- 2: Initial display line address : (00)_H
- 3: Column address : (00)_H
- 4: Page address : (0) page
- 5: Common direction register : Normal mode (D₃=“0”)
- 6: V₅ level is adjusted by external bleeder resistance (D₂, D₁, D₀=“1, 0, 0”)
- 7: EVR register : (D₅, D₄, D₃, D₂, D₁, D₀=“1, 0, 0, 0, 0, 0”)

A0	RDB	WRB	D ₇	D ₆	D ₅	D ₄	D ₃	D ₂	D ₁	D ₀
0	1	0	1	1	1	0	0	0	1	0

(o) Common driver direction select

This instruction selects common driver direction.

Please refer to (1-7) common driver direction for more detail.

A0	RDB	WRB	D ₇	D ₆	D ₅	D ₄	D ₃	D ₂	D ₁	D ₀
0	1	0	1	1	0	0	D ₃	*	*	*

(*: Don't Care)

- D₃ 0: Normal (C₀ → C₃₇)
- 1: Inverse (C₃₇ → C₀)

(p) Power control set

This instruction controls the status of internal power circuits. Please refer to the (1-9) LCD Driving Circuits (g) internal power circuits for more detail.

A0	RDB	WRB	D ₇	D ₆	D ₅	D ₄	D ₃	D ₂	D ₁	D ₀
0	1	0	0	0	1	0	1	D ₂	D ₁	D ₀

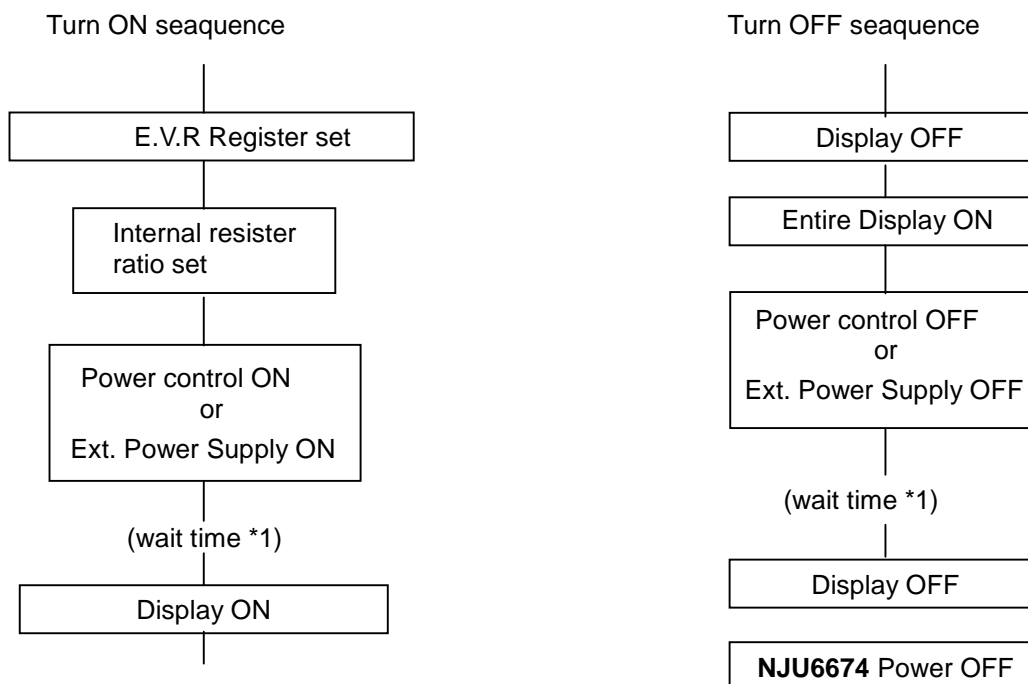

- D₂ 0: Voltage converter off
1: Voltage converter on
- D₁ 0: Voltage regulator off
1: Voltage regulator on
- D₀ 0: Voltage followers off
1: Voltage followers on

Note) The internal power supply must be Off when external power supply using.

* The wait time depends on the C₄ to C₈, C_{OUT} capacitors, and V_{DD} and V₅ Voltage. Therefore it requires the actual evaluation using the LCD module to get the correct time.

● LCD Driving power supply ON/OFF sequences.

The sequences below are required when the power supply turns ON/OFF. For the power supply turning on operation after the power-save mode(p), refer the "power save release" mentioned after.

(*1) The Internal Power Supply rise time is depending on the condition of the Supply Voltage, $V_{LCD}=V_{DD}-V_5$, External Capacitor of Booster, and External Capacitor connected to V₁ to V₅. To know the rise time correctly, test by using the actual LCD module. refer to (3-5) "LCD Driving Voltage Generation Circuits".

(q) Internal resistor ratio set

The "Internal resistor ratio set" instruction is used to determine the internal resistor ratio for the voltage regulator.

A0	RDB	WRB	D ₇	D ₆	D ₅	D ₄	D ₃	D ₂	D ₁	D ₀
0	1	0	0	0	1	0	0	A ₂	A ₁	A ₀

D ₂	D ₁	D ₀	Internal resistor ratio(1+Rb/Ra)	Internal resistor ratio(1+Rb/Ra)
0	0	0	3.0	Minimum
0	0	1	3.5	:
0	1	0	4.0	:
0	1	1	4.5	:
1	0	0	5.0	:
1	0	1	5.5	:
1	1	0	6.0	:
1	1	1	6.4	Maximum

(r),(s) EVR set

(r) EVR mode set

This instruction sets the LSI into the EVR mode, and it is always used by the combination with "EVR register set".

The LSI can't accept any instructions except the "EVR register set" during the EVR set mode. This mode will be released after the "EVR register set" instruction.

A0	RDB	WRB	D ₇	D ₆	D ₅	D ₄	D ₃	D ₂	D ₁	D ₀
0	1	0	1	0	0	0	0	0	0	1

(s) EVR register set

This instruction sets 6-bit data into the EVR register to determine the output voltage "V₅" of the internal voltage regulator.

A0	RDB	WRB	D ₇	D ₆	D ₅	D ₄	D ₃	D ₂	D ₁	D ₀	
0	1	0	*	*	D ₅	D ₄	D ₃	D ₂	D ₁	D ₀	(*: Don't Care)

D ₅	D ₄	D ₃	D ₂	D ₁	D ₀	V ₅
0	0	0	0	0	0	Minimum
0	0	0	0	0	1	:
:	:	:	:	:	:	:
:	:	:	:	:	:	:
1	1	1	1	1	1	Maximum

When EVR doesn't use, set the EVR register to D₅, D₄, D₃, D₂, D₁, D₀ = "1, 0, 0, 0, 0, 0".

(t) Power Save(complex command)

When Entire Display ON at the Display OFF states(inverse order also same), the internal circuits goes to the Power Save Mode and the operating current is dramatically reduced, almost same as the standby current. The internal states in the Power Save Mode is shown as follows;

- 1: The Oscillation Circuits and the Internal Power Supply Circuits stop the operation.
- 2: LCD driving is stopped. Segment and Common drives output V_{DD} level Voltage.
- 3: The display data and the internal operating condition are remained and kept as just before enter the Power Save Mode.
- 4: All the LCD driving bias voltage(V_1 to V_5) is fixed to the V_{DD} level.

The power save and its release perform according to the following sequences.

- *1: In the Power save sequence, the Power Save Mode starts after the Entire Display ON command is executed.
- *2: In the Power save Release sequence, Power Save Mode releases just after the Entire Display OFF instruction. The Display ON instruction is allowed to execute at any time after the Entire Display OFF instruction is completed.
- *3: The Internal Power Supply rise time depending on the condition of the Supply Voltage, $V_{LCD}=V_{DD}-V_5$, External Capacitor of Booster, and External Capacitor connected to V_1 to V_5 . To Know the rise time correctly, test by using the actual LCDmodule.
- *4: LCD Driving waveform is output after the execution of the Display ON instruction execution.
- *5: In case of the external power supply operation, the external power supply should be turned off before the Power Save Mode and connected to the V_{DD} for fixing the voltage. In this time, V_{OUT} terminal also should be made condition like as connection to V_{SS} .

(u) NOP

This instruction is Non Operation Instruction.

(v) Reserve, (w) Test

This instruction is used only for manufacturer's tests. (Don't Inhibited command)

(3) Internal Power Supply

(3-1) Voltage converter

The voltage converter generates maximum 4x boosted negative-voltage from the voltage between V_{DD} and V_{SS2} . The boosted voltage is output from the V_{OUT} terminal.

The internal oscillator is required to be operating when using this converter, because the divided signal provided from the oscillator is used for the internal timing of this circuit.

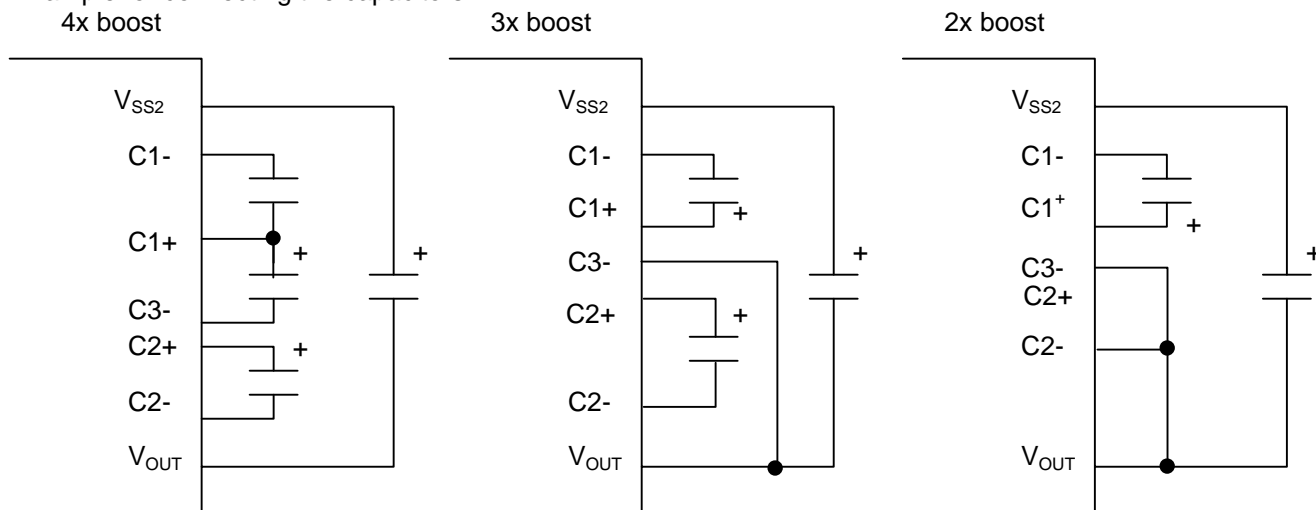

The boosted voltage between V_{DD} and V_{OUT} must not exceed 10.0V.

The voltage converter requires external capacitors for boosting as shown in below.

- The boosted voltage and V_{DD} , V_{SS2}

- Example for connecting the capacitors

(3-2) Contrast Adjustment by the EVR function

The EVR selects the V_{REG} voltage out of following 64 conditions by setting 6-bit data into the EVR register. When the EVR function, V_{EV} (refer: **Fig-3-a Voltage Adjust Circuit**) is controlled, and the LCD display contrast is adjusted. The EVR controls the voltage of V_{EV} by instruction and change the voltage of V_5 .

A step with EVR is set like table shown below.

n	EVR register		V_{EV} [V]	V_{LCD}
63	00 _H	(0,0,0,0,0,0)	$(99/162)V_{REG}$	Minimum
62	01 _H	(0,0,0,0,0,1)	$(100/162)V_{REG}$:
61	02 _H	(0,0,0,0,1,0)	$(101/162)V_{REG}$:
:	:	:	:	:
:	:	:	:	:
:	:	:	:	:
2	3D _H	(1,1,1,1,0,1)	$(160/162)V_{REG}$:
1	3E _H	(1,1,1,1,1,0)	$(161/162)V_{REG}$:
0	3F _H	(1,1,1,1,1,1)	$(162/162)V_{REG}$	Maximum

*1: $V_{LCD} = V_{DD} - V_5$

*2: In use of the EVR function, the voltage adjustment circuit must turn on by the power control instruction.

(3-3) Setting for internal resistor ratio

Either external or internal feedback resistors can be selected by setting the IRS terminal to "0" or "1".

The Internal resistor ratio selects 8 conditions of the feedback resistor ratio $(1+R_b/R_a)$. The feedback resistor ratio $(1+R_b/R_a)$ changing 3-bit data into the Internal resistor ratio register.

IRS	Ra, Rb
0	External resistors
1	Internal resistors

Internal resistor ratio register:			(Reference)
D ₂	D ₁	D ₀	$(1+R_b/R_a)$
0	0	0	3.0
0	0	1	3.5
0	1	0	4.0
0	1	1	4.5
1	0	0	5.0
1	0	1	5.5
1	1	0	6.0
1	1	1	6.4

(3-4) Voltage Adjust Circuit

The boosted voltage of V_{OUT} outputs V_5 for V_{LCD} driving through the voltage adjust circuit. This circuit is composed of high the V_{RS} , 64-level EVR and internal feedback resistor.

(a) Using Internal Resistor Ratio function (IRS="1")

The LCD driving voltage V_5 is determined in accordance with the setting for the EVR and the internal resistor ratio Instruction.

The output voltage of V_5 adjusted by changing with in the $V_5 > V_{OUT}$.

The output voltage is calculated by the following formula.

$$V_5 = (1 + R_b/R_a)V_{EV} = (1 + (R_b/R_a))(n/162)V_{REG} \quad (a-1)$$

V_{REG} : External Constant voltage (V_{RS})

n : EVR value

Fig-3-a Voltage Adjust Circuit

(b) Using external Ra and Rb resistors

In case that the external feedback resistors (Ra, Rb) are used by setting the IRS terminal to "0", these external resistors are required to be placed between the V_{DD} and V_R and between the V_R and V₅ terminals. The LCD driving voltage V₅ is determined in accordance with the setting for the EVR and the external resistor ratio.

The output voltage of V₅ adjusted by changing the Ra and Rb within the V₅>V_{OUT}.

The output voltage is calculated by the following formula.

$$V_5 = (1 + (Rb'/Ra')) V_{EV} = (1 + (Rb'/Ra')) (1 - (n/162)) V_{REG} \quad (b-1)$$

Fig-3-b Voltage Adjust Circuit

< Design example for R1 and R2 / Reference >

Condition : Ta=25°C, n=31, V_{REG}=-2.1V, EVR=1F_H,

$$V_5 = (1 + (Rb/Ra)) (n/162) V_{REG}$$

$$-7 = (1 + (Rb'/Ra')) (1 - (31/162)) (-2.1) \quad (b-2)$$

Determined by the current flown between V_{DD}-V₅ / 5uA.

$$Ra' + Rb' = 1.4M\Omega \quad (b-3)$$

Ra and Rb calculated by above conditions and the formula of (b-2, b-3) to mentioned below;

$$Rb'/Ra' = 3.12$$

$$Ra = 340k\Omega$$

$$Rb = 1060k\Omega$$

The adjustable V₅ range and step voltage table shown below.

V ₅	Min.	Typ.	Max.	UNIT
Adjustable Range	-8.6 (63 Step)	-7.0 (32 Step)	-5.3(0 Step)	[V]
Step Voltage		52		[mV]

(3-5) LCD Driving Voltage Generation Circuits

The LCD driving bias voltage of V_1, V_2, V_3, V_4 are generated by dividing the V_5 voltage with the internal bleeder resistance and is supplied to the LCD driving circuits after the impedance conversion by the voltage follower.

The external capacitors to V_1 to V_5 for Bias voltage stabilization may be removed in use of small size LCD panel. The equivalent load of LCD panel may be changed depending on display patterns. Therefore, it require display quality check on various display patterns actually without external capacitors. If the display quality is not so good, external capacitors should connects as show in Fig. 4. (If no need external capacitors as result of experiment, the application patterns (wiring) should be prepared for recovery.)

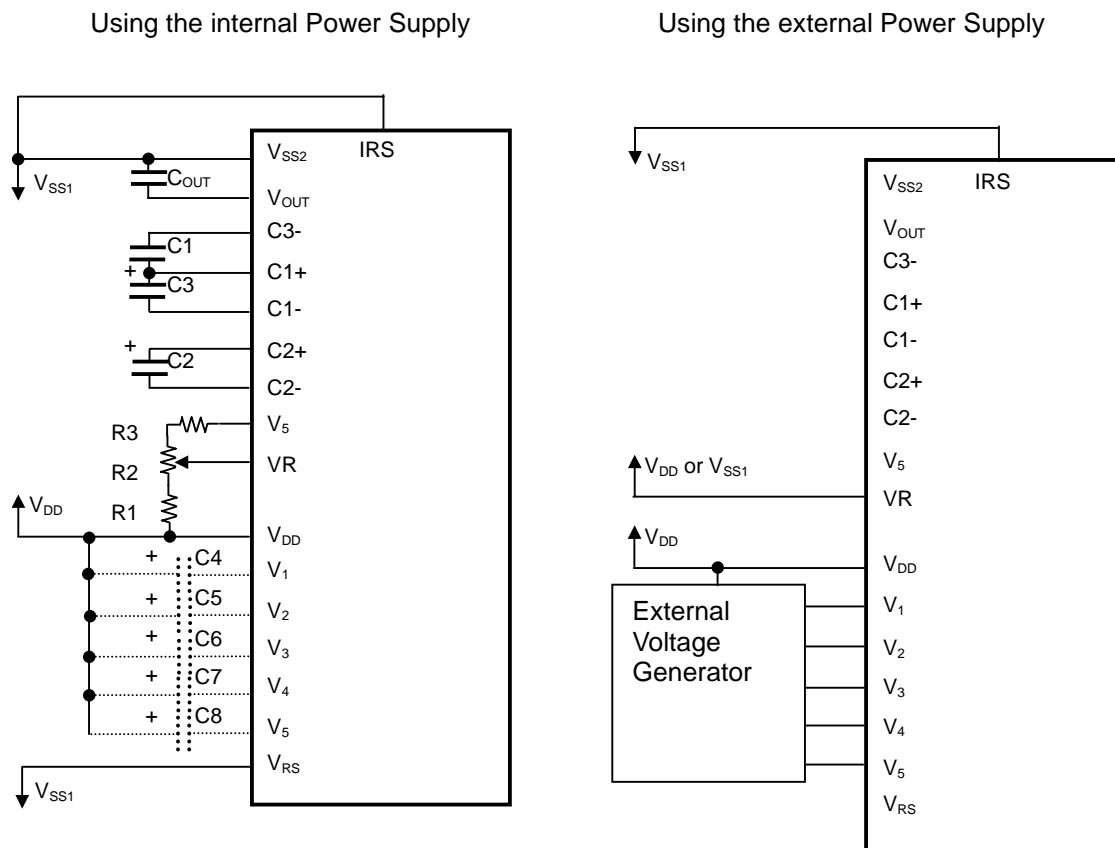

Fig.4

Reference set up value $V_{LCD}=V_{DD}-V_5=5.0$ to $9.0V$

- *1 Short wiring or sealed wiring to the VR terminal is required due to the high impedance of VR terminal.
- *2 Following connection of V_{OUT} is required when external power supply using.
 When $V_{SS} > V_5$, $V_{OUT} = V_5$
 When $V_{SS} \leq V_5$, $V_{OUT} = V_{SS}$
- *3 Bias capacitors are selected depending on the LCD panel.
 The evaluation in various display patterns should be experimented in the application

C_{OUT}	$\sim 1.0\mu F$
C1, C2, C3	$\sim 1.0\mu F$
C4 to C7	0.1 to $0.47\mu F$
R_1	264k Ω
R_2	211k Ω
R_3	925k Ω

(4) MPU Interface

(4-1) Interface type selection

NJU6674 interfaces with MPU by 8-bit bi-directional data bus (D₇ to D₀) or serial (SI:D₇). The 8 bit parallel or serial interface is determined by a condition of the P/S terminal connecting to "H" or "L" level as shown in Table 5. In case of the serial interface, status and RAM data read out operation is impossible.

Table 5

P/S	I/F type	CS ₁ B	CS ₂	A0	RDB	WRB	SEL68	D ₇	D ₆	D ₅ - D ₀
H	Parallel	CS ₁ B	CS ₂	A0	RDB	WRB	SEL68	D ₇	D ₆	D ₅ - D ₀
L	Serial	CS ₁ B	CS ₂	A0	-	-	-	SI	SCL	Hi-Z

"Hi-Z" mark: Hi-impedance "-" mark: Fix to "H" or "L"

(4-2) Parallel Interface

The **NJU6674** interfaces the 68- or 80-type MPU directly if the parallel interface (P/S="H") is selected.

The 68-type or 80-type MPU is selected by connecting the SEL68 terminal to "H" or "L" as shown in table 6.

Table 6

SEL68	Type	CS ₁ B	CS ₂	A0	RDB	WRB	D ₇ - D ₀
H	68-type MPU	CS ₁ B	CS ₂	A0	E	R/WB	D ₇ - D ₀
L	80-type MPU	CS ₁ B	CS ₂	A0	RDB	WRB	D ₇ - D ₀

(4-3) Discrimination of Data Bus Signal

The **NJU6674** discriminates the mean of signal on the data bus by the combination of A0, E, R/WB, and (RDB, WRB) signals as shown in Table 7.

Table 7

common	68 type	80 type		Function
	R/WB	RDB	WRB	
H	H	L	H	Read Display Data
H	L	H	L	Write Display Data
L	H	L	H	Status Read
L	L	H	L	Write into the Register(Instruction)

(4-4) Serial Interface.(P/S="L")

The serial interface of the **NJU6674** consists of the 8-bit shift register and 3-bit counter. In case the chip is selected ($CS_1B="L"$, $CS_2="H"$), the input to $D_7(SI)$ and $D_6(SCL)$ becomes available, and in case that the chip isn't selected, the shift register and the counter are reset to the initial condition.

The data input from the terminal(SI) is MSB first like as the order of D_7, D_6, \dots, D_0 , by a serial interface, it is entered into with rise edge of serial clock(SCL). The data converted into parallel data of 8-bit with the rise edge of 8th serial clock and processed.

It discriminates display data or instructions by A0 input terminal. A0 is read with rise edge of (8 X n)th of serial clock (SCL), it is recognized display data by $A0="H"$ and instruction by $A0="L"$ A0 input is read in the rise edge of (8 X n)th of serial clock (SCL) after chip select and distinguished.

However, in case of $RESB="H"$ to "L" or $CS_1B="L"$ to "H" and $CS_2="H"$ to "L" with trasfered data does not fill 8 bit, attention is necessary because it will processed as there was command input. Always, input the data of (8 X n) style.

The SCL signal must be careful of the termination reflection by the wiring length and the external noise and confirmation by the actual machine is recommended by it.

Fig.5

(4-5) Access to the Display Data RAM and Internal Register.

The **NJU6674** transfers data to the MPU through the bus holder with the internal data bus.

In case of reading out the display data contents in the DD RAM, the data which was read in the first data read cycle (= the dummy read) is memorized in the bus holder. Then the data is read out to the system bus from the bus holder in the next data read cycle. Also, In case that the MPU writes into DD RAM, the data is temporarily stored in the bus holder and is then written into DD RAM by the next data write cycle.

Therefore, the limitation of the access to **NJU6674** from MPU side is not access time (t_{ACC} , t_{DS}) of Display Data RAM and the cycle time becomes dominant. With this, speed-up of the data transfer with the MPU becomes possible. In case of cycle time isn't met, the MPU inserts NOP operation only and becomes an equivalent to an execution of wait operation on the satisfy condition in MPU.

When setting an address, the data of the specified address isn't output immediately by the read operation after setting an address, and the data of the specified address is output at the 2nd data read operation. Therefore, the dummy read is always necessary once after the address set and the write cycle. (See Fig. 6)

The example of Read Modify Write operation is mentioned in (3)Instruction -I)The sequence of Inverse Display.

● Write Operation

● Read Operation

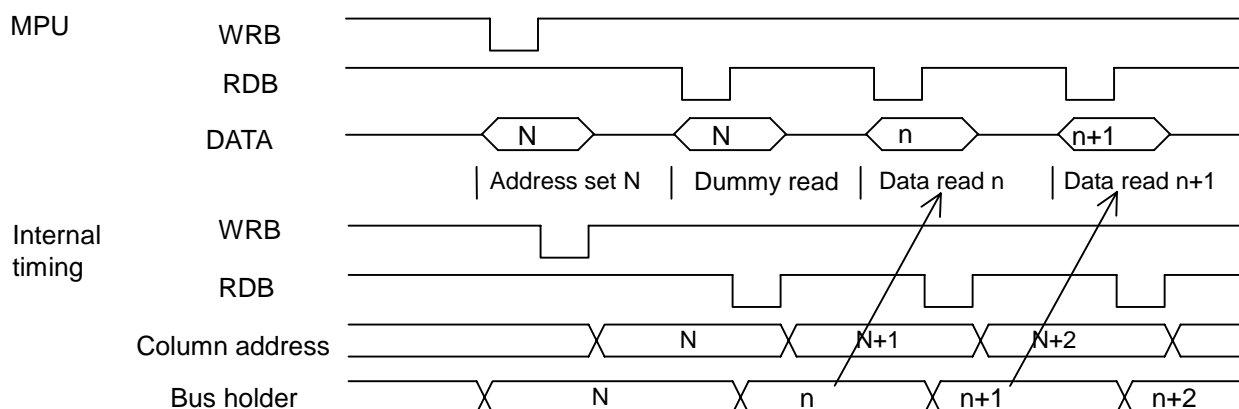

Fig.6

(4-6) Chip Select

CS_1B , CS_2 is Chip Select terminal. In case of $CS_1B="L"$ and $CS_2="H"$. the interface with MPU is available. In case of $CS_1B="H"$ or $CS_2="L"$, the D_0 to D_7 are high impedance and A_0 , RDB , WRB , SI and SCL inputs are ignored. If the serial interface is selected when $CS_1B="H"$ or $CS_2="L"$ the shift register and counter are reset. However, the reset is always operated in any conditions of CS_1B , CS_2 .

■ ABSOLUTE MAXIMUM RATINGS

PARAMETER	SYMBOL	RATINGS	UNIT
Supply Voltage(1)	V_{DD}	-0.3 to +7.0	V
		-0.3 to +3.6(Used Tripler)	
Supply Voltage(2)	V_{SS2}	-7.0 to +0.3	V
		-3.6 to +0.3(Used Tripler)	
Supply Voltage(3)	V_5, V_{OUT}	$V_{DD}-11.0$ to $V_{DD}+0.3$	V
Supply Voltage(4)	V_1, V_2, V_3, V_4	V_5 to $V_{DD}+0.3$	V
Supply Voltage(5)	V_{RS}	-7.0 to +0.3	V
Input Voltage	V_{IN}	-0.3 to $V_{DD}+0.3$	V
Operating Temperature	T_{opr}	-40 to +85	°C
Storage temperature	T_{stg}	-55 to +125	°C

Note 1) All voltage values are specified as $V_{SS1}=0V$.

Note 2) The relation of $V_{DD} \geq V_1 \geq V_2 \geq V_3 \geq V_4 \geq V_5 > V_{OUT}$; $V_{DD} > V_{SS1} \geq V_{OUT}$ must be maintained.

In case of inputting external LCD driving voltage, the LCD drive voltage should start supplying to **NJU6674** at the mean time of turning on V_{DD} power supply or after turned on V_{DD} .

In use of the voltage boost circuit, the condition that the supply voltage: $11.0V \geq V_{DD} - V_{OUT}$ is necessary.

Note 3) If the LSI are used on condition beyond the absolute maximum rating, the LSI may be destroyed. Using LSI within electrical characteristics is strongly recommended for normal operation.

Use beyond the electric characteristics conditions will cause malfunction and poor reliability.

Note 4) Decoupling capacitor should be connected between V_{DD} and V_{SS1} due to the stabilized operation for the voltage converter.

DC Electrical Characteristics

(V_{DD}=2.4V to 3.3V, V_{SS}=0V, Ta=-20 to 75°C)

Address set up time	t_{SAS}	A0		150			
Address hold time	t_{SAH}			150			
Data set up time	t_{SDS}	SI		100			
Data hold time	t_{SDH}			100			
CS-SCL time	t_{CSS}	CS ₁ B, CS ₂		150			
	t_{CSH}			150			
Input signal rising, falling edge	t_r, t_f	CS ₁ B, CS ₂ SCL, SI, A0				15	

*:All timing based on 20% and 80% of V_{DD} voltage level.

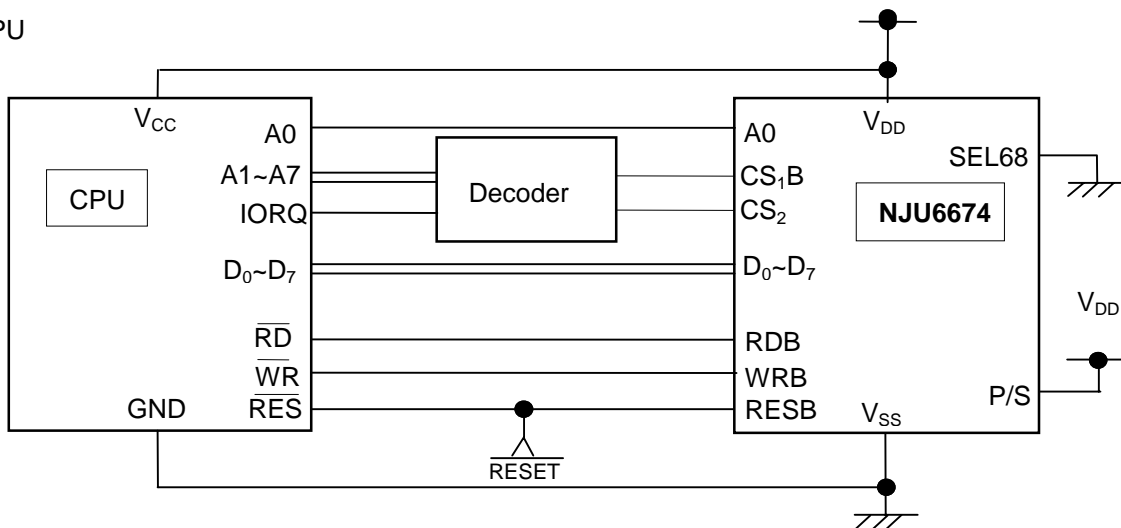

■ LCD DRIVING WAVEFORM

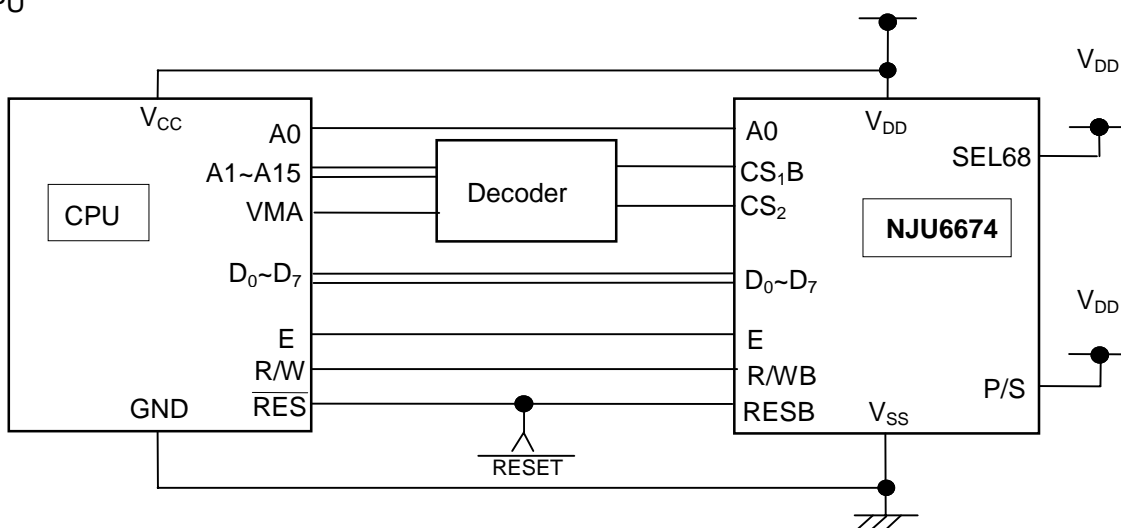

APPLICATION CIRCUIT

- (1) Microprocessor Interface Example
 The NJU6674 interfaces to 80 type or 68 type MPU directly.
 And the serial interface also communicate with MPU.
 * : C86 terminal must be fixed V_{DD} or V_{SS} .

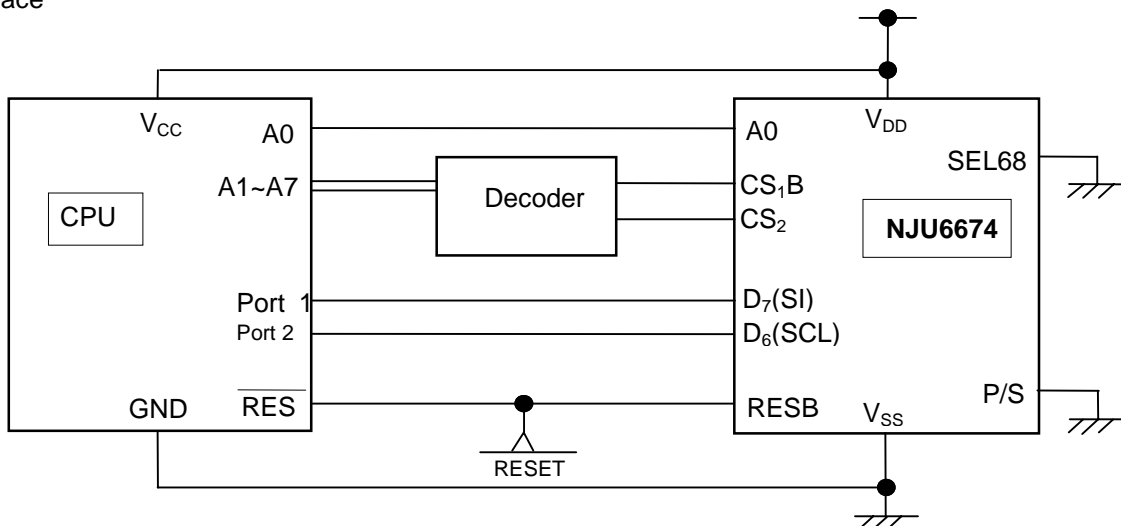

80 Type MPU

68 Type MPU

Serial Interface

MEMO

[CAUTION]

The specifications on this databook are only given for information , without any guarantee as regards either mistakes or omissions. The application circuits in this databook are described only to show representative usages of the product and not intended for the guarantee or permission of any right including the industrial rights.
