

Preliminary

*Notice: This is not final specification.
Some parametric limits are subject to change.*

DESCRIPTION

The M5M5T5672TG is a family of 18M bit synchronous SRAMs organized as 262144-words by 72-bit. It is designed to eliminate dead bus cycles when turning the bus around between reads and writes, or writes and reads. Renesas's SRAMs are fabricated with high performance, low power CMOS technology, providing greater reliability. M5M5T5672TG operates on a single 2.5V power supply and are 2.5V CMOS compatible.

FEATURES

- Fully registered inputs and outputs for pipelined operation
- Fast clock speed: 200 MHz
- Fast access time: 3.2 ns
- Single 2.5V –5% and +5% power supply VDD
- Individual byte write (BWA# - BWH#) controls may be tied LOW
- Single Read/Write control pin (W#)
- Snooze mode (ZZ) for power down
- Linear or Interleaved Burst Modes
- JTAG boundary scan support

APPLICATION

High-end networking products that require high bandwidth, such as switches and routers.

PACKAGE

	Bump	Body Size	Bump Pitch
M5M5T5672TG	209(11X19) bump BGA	14mm X 22mm	1mm

PART NAME TABLE

Part Name	Access	Cycle	Active Current (max.)	Standby Current (max.)
M5M5T5672TG -20	3.2ns	5.0ns	450mA	30mA

FUNCTION

Synchronous circuitry allows for precise cycle control triggered by a positive edge clock transition.

Synchronous signals include : all Addresses, all Data Inputs, all Chip Enables (E1#, E2, E3#), Address Advance/Load (ADV), Byte Write Enables (BWA#, BWb#, BWc#, BWd#, BWE#, BWf#, BWg#, BWh#) and Read/Write (W#).

Write operations are controlled by the eight Byte Write Enables (BWA# - BWh#) and Read/Write(W#) inputs. All writes are conducted with on-chip synchronous self-timed write circuitry.

Asynchronous inputs include Output Enable (G#), Clock (CLK) and Snooze Enable (ZZ).

The HIGH input of ZZ pin puts the SRAM in the power-down state.

The Linear Burst order (LBO#) is DC operated pin. LBO# pin will allow the choice of either an interleaved burst, or a linear burst.

All read, write and deselect cycles are initiated by the ADV Low input. Subsequent burst address can be internally generated as controlled by the ADV HIGH input.

DC OPERATED TRUTH TABLE

Name	Input Status	Operation
LBO#	HIGH or NC	Interleaved Burst Sequence
	LOW	Linear Burst Sequence

Note4. LBO# is DC operated pin.

Note5. NC means No Connection.

Note6. See BURST SEQUENCE TABLE about interleaved and Linear Burst Sequence.

BURST SEQUENCE TABLE

(1) Interleaved Burst Sequence (when LBO# = HIGH or NC)

Operation	A17~A2	A1,A0			
First access, latch external address	A17~A2	0, 0	0, 1	1, 0	1, 1
Second access(first burst address)	latched A17~A2	0, 1	0, 0	1, 1	1, 0
Third access(second burst address)	latched A17~A2	1, 0	1, 1	0, 0	0, 1
Fourth access(third burst address)	latched A17~A2	1, 1	1, 0	0, 1	0, 0

(2) Linear Burst Sequence (when LBO# = LOW)

Operation	A17~A2	A1,A0			
First access, latch external address	A17~A2	0, 0	0, 1	1, 0	1, 1
Second access(first burst address)	latched A17~A2	0, 1	1, 0	1, 1	0, 0
Third access(second burst address)	latched A17~A2	1, 0	1, 1	0, 0	0, 1
Fourth access(third burst address)	latched A17~A2	1, 1	0, 0	0, 1	1, 0

Note7. The burst sequence wraps around to its initial state upon completion.

TRUTH TABLE

E1#	E2	E3#	ADV	W#	BWx#	G#	CKE#	ZZ#	CLK	Address used	Operation
H	X	X	L	X	X	X	L	L	L->H	None	Deselect Cycle
X	L	X	L	X	X	X	L	L	L->H	None	Deselect Cycle
X	X	H	L	X	X	X	L	L	L->H	None	Deselect Cycle
X	X	X	H	X	X	X	L	L	L->H	None	Continue Deselect Cycle
L	H	L	L	H	X	L	L	L	L->H	External	Read Cycle, Begin Burst
X	X	X	H	X	X	L	L	L	L->H	Next	Read Cycle, Continue Burst
L	H	L	L	H	X	H	L	L	L->H	External	NOP/Dummy Read, Begin Burst

X	X	X	X	X	X	X	H	L	L->H	Current	Ignore Clock edge, Stall
X	X	X	X	X	X	X	X	H	X	None	Snooze Mode

Note8. "H" = input VIH; "L" = input VIL; "X" = input VIH or VIL.

Note9. BWx#=H means all Synchronous Byte Write Enables (BWa#,BWb#,BWc#,BWd#) are HIGH. BWx#=L means one or more Synchronous Byte Write Enables are LOW.

Note10. All inputs except OE# and ZZ must meet setup and hold times around the rising edge (LOW to HIGH) of CLK.

STATE DIAGRAM

Note11. The notation "x , x , x" controlling the state transitions above indicate the state of inputs E, ADV and W# respectively.
 Note12. If (E1# = L and E2 = H and E3# = L) then E="T" else E="F".
 Note13. "H" = input VIH; "L" = input VIL; "X" = input VIH or VIL; "T" = input "true"; "F" = input "false".

DC ELECTRICAL CHARACTERISTICS

Symbol	Parameter	Condition	Limits		Unit
			Min	Max	
VDD	Power Supply Voltage		2.375	2.625	V
VDDQ	I/O Buffer Power Supply Voltage		2.375	2.625	V
V _{IH}	High-level Input Voltage		1.7	VDDQ+0.3*	V
V _{IL}	Low-level Input Voltage		-0.3*	0.7	V
V _{OH}	High-level Output Voltage	I _{OH} = -2.0mA	VDDQ-0.4		V
V _{OL}	Low-level Output Voltage	I _{OL} = 2.0mA		0.4	V
I _{LI}	Input Leakage Current except ZZ and LBO#	V _I = 0V ~ VDDQ		10	μA
	Input Leakage Current of LBO#	V _I = 0V ~ VDDQ		100	
	Input Leakage Current of ZZ	V _I = 0V ~ VDDQ		100	
I _{LO}	Output Leakage Current	V _{I/O} = 0V ~ VDDQ		10	μA
ICC1	Power Supply Current : Operating	Device selected; Output Open, V _I ≤ V _{IL} or V _I ≥ V _{IH} , ZZ ≤ V _{IL}		450	mA
ICC2	Power Supply Current : Deselected	Device deselected V _I ≤ V _{IL} or V _I ≥ V _{IH} , ZZ ≤ V _{IL}		180	mA
ICC3	CMOS Standby Current (CLK stopped standby mode)	Device deselected; Output Open V _I ≤ V _{SS} +0.2V or V _I ≥ VDDQ-0.2V CLK frequency=0Hz, All inputs static		30	mA
ICC4	Snooze Mode Standby Current	Snooze mode ZZ ≥ VDDQ-0.2V, LBO# ≥ VDD-0.2V		30	mA
ICC5	Stall Current	Device selected; Output Open, CKE# ≥ V _{IH} V _I ≤ V _{SS} +0.2V or V _I ≥ VDDQ-0.2V		140	mA

Note17.*V_{ILmin} is -1.0V and V_{IHmax} is VDDQ+1.0V in case of AC(Pulse width ≤ 2ns).

Note18."Device Deselected" means device is in power-down mode as defined in the truth table.

CAPACITANCE

Symbol	Parameter	Condition	Limits			Unit
			Min	Typ	Max	
C _i	Input Capacitance	V _I =GND, V _I =25mVrms, f=1MHz			6	pF
C _o	Input / Output (DQ) Capacitance	V _o =GND, V _o =25mVrms, f=1MHz			8	pF

Note19. This parameter is sampled.

THERMAL RESISTANCE

4-Layer PC board mounted (70x70x1.6mmT)

Symbol	Parameter	Condition	Limits			Unit

		Air velocity=2m/sec		18		°C/W
θJC	Thermal resistance Junction to Case			6		°C/W

AC ELECTRICAL CHARACTERISTICS (Ta=0~70°C, VDD=VDDQ=2.375~2.625V, unless otherwise noted)

(1) MEASUREMENT CONDITION

- Input pulse levels $V_{IH}=V_{DDQ}$, $V_{IL}=0V$
- Input rise and fall times faster than or equal to 1V/ns
- Input timing reference levels $V_{IH}=V_{IL}=V_{DDQ} / 2$
- Output reference levels $V_{IH}=V_{IL}=V_{DDQ} / 2$
- Output load Fig.1

Fig.1 Output load

Fig.2 Tdly measurement

Fig.3 Tri-State measurement

Note20. Valid Delay Measurement is made from the $V_{DDQ}/2$ on the input waveform to the $V_{DDQ}/2$ on the output waveform.

Input waveform should have a slew rate of faster than or equal to 1V/ns.

Note21. Tri-state toff measurement is made from the $V_{DDQ}/2$ on the input waveform to the output waveform moving 20% from its initial to final Value $V_{DDQ}/2$.

Note: the initial value is not VOL or VOH as specified in DC ELECTRICAL CHARACTERISTICS table.

Note22. Tri-state ton measurement is made from the $V_{DDQ}/2$ on the input waveform to the output waveform moving 20% from its initial Value $V_{DDQ}/2$ to its final Value.

Note: the final value is not VOL or VOH as specified in DC ELECTRICAL CHARACTERISTICS table.

Note23. Clocks, Data, Address and control signals will be tested with a minimum input slew rate of faster than or equal to 1V/ns.

tKHAX	Clock HIGH to Address don't care	0.8		ns
tKHadvX	Clock HIGH to ADV don't care	0.8		ns
tKHwx	Clock HIGH to Write don't care	0.8		ns
tKHBxX	Clock HIGH to Byte Write don't care (BWA#~BWh#)	0.8		ns
tKHEx	Clock HIGH to Enable don't care (E1#,E2,E3#)	0.8		ns
tKHDX	Clock HIGH to Data In don't care	0.8		ns
ZZ				
tZZS	ZZ standby		2*tKHKH	ns
tZZREC	ZZ recovery		2*tKHKH	ns

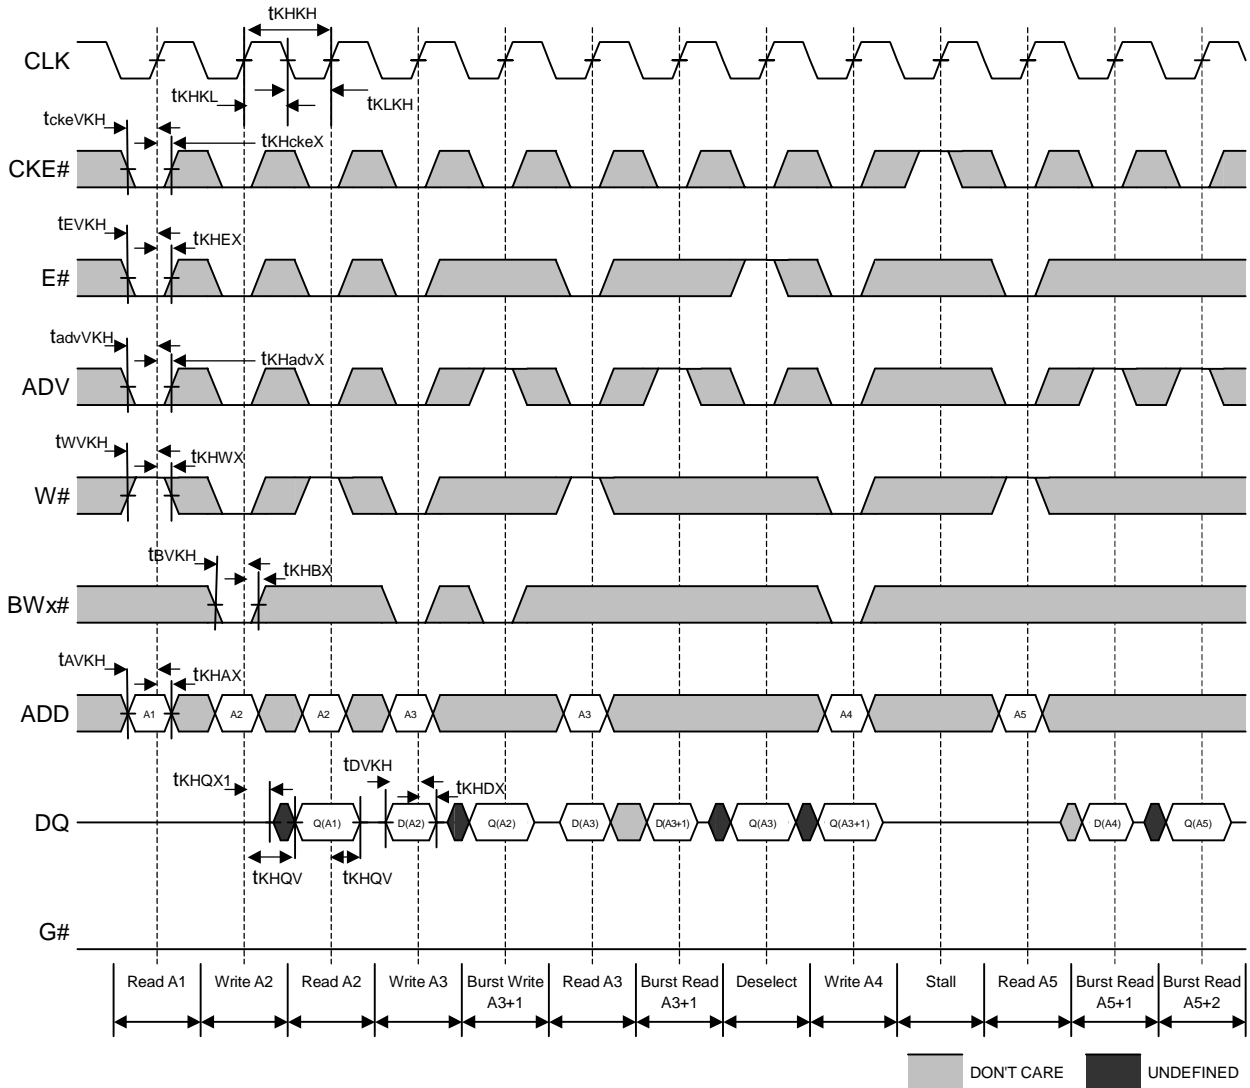

Note24.All parameter except tZZS, tZZREC in this table are measured on condition that ZZ=LOW fix.

Note25.Test conditions is specified with the output loading shown in Fig.1 unless otherwise noted.

Note26. tKHQX1, tKHQZ, tGLQX1, tGHQZ are sampled.

Note27.LBO# is static and must not change during normal operation.

(5) READ/WRITE TIMING

Note34. Q(An) refers to output from address An. Q(An+1) refers to output from the next internal burst address following An.
 Note35. E# represents three signals. When E# is LOW, it represents E1# is LOW, E2 is HIGH and E3# is LOW.
 Note36. ZZ is fixed LOW.

(6)SNOOZE MODE TIMING

JTAG PORT OPERATION

Overview

The JTAG Port on this SRAM operates in a manner consistent with IEEE Standard 1149.1-1990, a serial boundary scan interface standard (commonly referred to as JTAG), but does not implement all of the function required for 1149.1 compliance. Unlike JTAG implementations that have been common among SRAM vendors for the last several years, this implementation does offer a form of EXTEST, known as Clock Assisted EXTEST, reducing or eliminating the "hand coding" that has been required to overcome the test program compiler errors caused by previous non-compliant implementation. The JTAG Port interfaces with conventional CMOS logic level signaling.

Disabling the JTAG port

It is possible to use this device without utilizing the JTAG port. The port is reset at power-up and will remain inactive unless clocked. To assure normal operation of the SRAM with the JTAG Port unused, the TCK, TDI and TMS pins may be left floating or tied to High. The TDO pin should be left unconnected.

JTAG Pin Description

Pin	Name	Function
TCK	Test Clock	The TCK input is clock for all TAP events. All inputs are captured on the rising edge of TCK and the Test Data Out (TDO) propagates from the falling edge of TCK.
TMS	Test Mode Select	The TMS input is sampled on the rising edge of TCK. This is the command input for the TAP Controller state machine. An undriven TMS input will produce the same result as a logic one input level.
TDI	Test Data In	The TDI input is sampled on the rising edge of TCK. This is the input side of the serial registers placed between the TDI and TDO pins. The register placed between the TDI and TDO pins is determined by the state of the TAP Controller state machine and the instruction that is currently loaded in the TAP Instruction Register (refer to the TAP Controller State Diagram). An undriven TDI Input will produce the same result as a logic one input level.
TDO	Test Data Out	The TDO output is active depending on the state of the TAP Controller state machine. Output changes in response to the falling edge of TCK. This is the output side of the serial registers placed between the TDI and TDO pins.

Note:

This device does not have a TRST (TAP Reset) pin. TRST is optional in IEEE 1149.1. The Test-Logic-Reset state is entered while TMS is held high for five rising edges of TCK. The TAP Controller is also reset automatically at power-up.

JTAG Port Registers

Overview

The various JTAG registers, referred to as Test Access Port or TAP Registers, are selected (one at a time) via the sequence of 1s and 0s applied to TMS as TCK is strobed. Each of TAP Registers are serial shift registers that capture serial input data on the rising edge of TCK and push serial data out on the next falling edge of TCK. When a register is selected, it is placed between the TDI and TDO pins.

Instruction Register

The Instruction Register holds the instructions that are executed by the TAP Controller when it is moved into the Run-Test/Idle, or the various data register states. Instructions are 3 bits long. The Instruction Register can be loaded when it is placed between the TDI and TDO pins. The Instruction Register is automatically preloaded with the IDCODE instruction at power-up or whenever the controller is placed in the Test-Logic-Reset state.

Bypass Register

The Bypass register is a single-bit register that can be placed between the TDI and TDO pins. It allows serial test data to be passed through the SRAM's JTAG Port to another device in the scan chain with as little delay as possible.

Boundary Scan Register

The Boundary Scan Register is a collection of flip flops that can be preset by the logic level found on the SRAM's input or I/O pins. The flip flops are then daisy chained together so the levels found can be shifted serially out of the JTAG Port's TDO pins. The Boundary Scan Register also includes a number of place holder flip flops (always set to a logic 1). The relationship between the device pins and the bits in the Boundary Scan Register is described in the Scan Order Table following. The Boundary Scan Register, under the control of the TAP Controller, is loaded with the contents of the SRAM's I/O ring when the controller is in the Capture-RD state and then is placed between the TDI and TDO pins when the controller is moved to the Shift-DR state. SAMPLE-Z, SAMPLE/PRELOAD and EXTEST instruction can be used to activate the Boundary Scan Register.

Identification (ID) Register

The ID register is a 32-bit register that is loaded with a device and vendor specific 32-bit code when the controller is put in the Capture-DR state with the IDCODE Instruction loaded in the Instruction Register. The code is loaded from 32-bit on-chip ROM. It describes various attributes of the SRAM (see page 25). The register is then placed between the TDI and TDO pins when the controller is moved into the Shift-DR state. Bit 0 in the register is the LSB and the first to reach the TDO pin when shifting begins.

TAP Controller Instruction Set

Overview

There are two classes of instructions defined in the Standard 1149.1-1990; standard (Public) instructions, and device specific (Private) instructions. Some Public instructions are mandatory for 1149.1 compliance. Optional Public instructions must be implemented in prescribed ways. Although the TAP Controller in this device follows the 1149.1 conventions, it is not 1149.1-compliant because one of the mandatory instructions, EXTEST, is uniquely implemented. The TAP on this device may be used to monitor all input and I/O pads. This device will not perform INTEST but can perform the preload portion of the SAMPLE/PRELOAD command.

When the TAP controller is placed in the Capture-IR state, the two least significant bits of the instruction register are loaded with 01. When the TAP controller is moved to the Shift-IR state, the Instruction Register is placed between the TDI and TDO pins. In this state the desired instruction is serially loaded through the TDI input (while the previous contents are shifted out at the TDO output). For all instructions, the TAP executes newly loaded instructions only when the controller is moved to the Update-IR state. The TAP Instruction Set for this device is listed in the following table.

Instruction Descriptions

BYPASS

When the BYPASS instruction is loaded in the Instruction Register, the Bypass Register is placed between the TDI and TDO pins. This occurs when the TAP Controller is moved to the Shift-DR state. This allows the board level scan path to be shortened to facilitate testing of other devices in the scan path.

SAMPLE/PRELOAD

SAMPLE/PRELOAD is a Standard 1149.1 mandatory public instruction. When the SAMPLE/PRELOAD instruction is loaded in the Instruction Register, moving the TAP Controller into the Capture-DR state loads the data in the SRAM's input and I/O buffers into the Boundary Scan Register. Some Boundary Scan Register locations are not associated with an input or I/O pin, and are loaded with the default state identified in the BSDL file. Because the SRAM clock is independent from the TAP Clock (TCK) it is possible for the TAP to attempt to capture the I/O ring contents while the input buffers are in transition (i.e. in a metastable state). Although allowing the TAP to sample metastable inputs will not harm the device, repeatable results cannot be expected. SRAM input signals must be stabilized for long enough to meet the TAP's input data capture set-up plus hold time (t_{TS} plus t_{TH}). The SRAM's clock inputs need not be paused for any other TAP operation except capturing the I/O ring contents into the Boundary Scan Register. Moving the controller to the Shift-DR state then places the Boundary Scan Register between the TDI and TDO pins.

EXTEST

EXTEST is an IEEE 1149.1 mandatory public instruction. It is to be executed whenever the Instruction Register is loaded with all logic 0s. EXTEST is not implemented in the TAP Controller, and therefore this device is not compliant to the 1149.1 Standard. When the EXTEST instruction is loaded into the Instruction Register, the device responds as if the SAMPLE/PRELOAD instruction has been loaded. There is one difference between the two instructions. Unlike the SAMPLE/PRELOAD instruction, EXTEST place the SRAM outputs in a High-Z state.

IDCODE

The IDCODE instruction cause the ID ROM to be loaded into the ID register when the controller is in the Capture-DR state and places the ID Register between the TDI and TDO pins in the Shift-DR state. The IDCODE instruction is the default instruction loaded in at power-up and any time the controller is placed in the Test-Logic-Reset state.

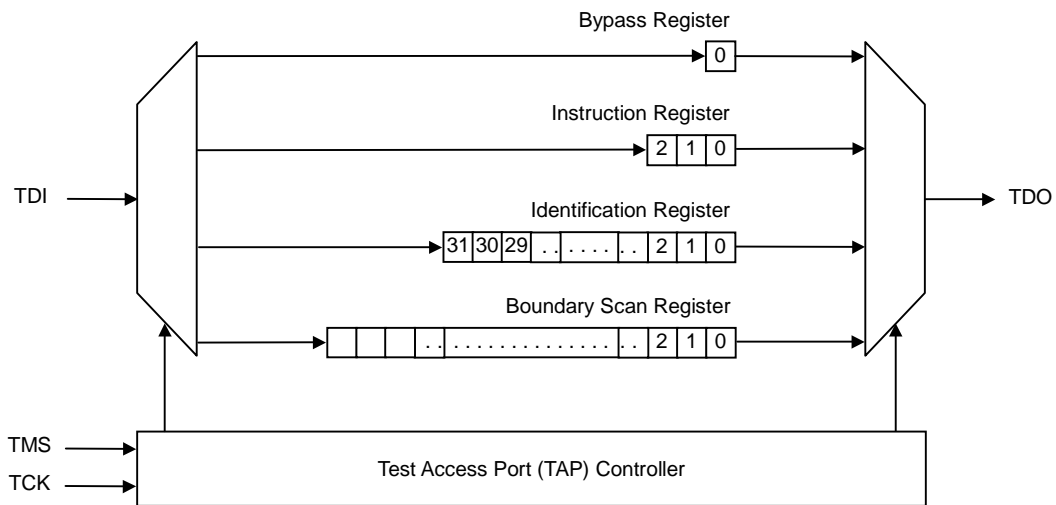

SAMPLE-Z

If the SAMPLE-Z instruction is loaded in the Instruction Register, all SRAM outputs are forced to an inactive drive state (High-Z) and the Boundary Scan Register is placed between the TDI and TDO pins when the TAP Controller is moved to the Shift-DR state.

RFU

These instructions are reserved for future use. Do not use these instructions.

JTAG TAP CONTROLLER STATE DIAGRAM

TAP CONTROLLER DC ELECTRICAL CHARACTERISTICS (Ta=0~70°C, VDD=2.375~2.625V, unless otherwise noted)

Symbol	Parameter	Condition	Limits		Unit
			Min	Max	
VIHT	Test Port Input High Voltage		1.7	VDDQ+0.3 **	V
VILT	Test Port Input Low Voltage		-0.3 **	0.7	V
VOHT	Test Port Output High Voltage	IOH=-100μA	VDDQ-0.1	-	V
VOLT	Test Port Output Low Voltage	IOL=+100μA	-	0.1	V
IINT	TMS, TCK and TDI Input Leakage Current		-10	10	μA
IOLT	TDO Output Leakage Current	Output Disable, VOUT=0V~VDDQ	-10	10	μA

Note37. **Input Undershoot/Overshoot voltage must be -1.0V<Vi<VDDQ+1V with a pulse width not to exceed 20% tTCK.

TAP CONTROLLER AC ELECTRICAL CHARACTERISTICS (Ta=0~70°C, VDD=2.375~2.625V, unless otherwise noted)

(1) MEASUREMENT CONDITION

- Input pulse levels $V_{IH}=V_{DDQ}$, $V_{IL}=0V$
- Input rise and fall times faster than or equal to 1V/ns
- Input timing reference levels $V_{IH}=V_{IL}=V_{DDQ} / 2$
- Output reference levels $V_{IH}=V_{IL}=V_{DDQ} / 2$
- Output load Fig.4

Fig.4 Output load

(2) TIMING CHARACTERISTICS

Symbol	Parameter	Limits		Unit
		Min	Max	
tTF	TCK Frequency		20	MHz
tTKC	TCK Cycle Time	50		ns
tTKH	TCK High Pulse Width	20		ns
tTKL	TCK Low Pulse Width	20		ns
tTS	TDI, TMS setup time	10		ns
tTH	TDI, TMS hold time	10		ns
tTKQ	TCK Low to TDO valid		20	ns

(3) TIMING

JTAG TAP INSTRUCTION SET SUMMARY

Instruction	Code	Description
EXTEST	000	Captures I/O ring contents. Places the Boundary Scan Register between TDI and TDO. Forces all SRAM outputs to High-Z state. This instruction is not 1149.1-compliant.
IDCODE	001	Preloads ID Register and places it between TDI and TDO
SAMPLE-Z	010	Captures I/O ring contents. Places the Boundary Scan Register between TDI and TDO. Forces all Data and Clock output drivers to High-Z
RFU	011	Do not use this instruction; Reserved for Future Use.
SAMPLE/PRELOAD	100	Captures I/O ring contents. Places the Boundary Scan Register between TDI and TDO.
RFU	101	Do not use this instruction; Reserved for Future Use.
RFU	110	Do not use this instruction; Reserved for Future Use.
BYPASS	111	Places the BYPASS Register between TDI and TDO.

REVISION HISTORY

Rev.No.	History	Date	
0.0	First revision	September 25, 2002	Preliminary
0.1	DC ELECTRICAL CHARACTERISTICS Changed ILI limit from 10uA to 100uA (Input Leakage Current of ZZ and LBO#) Changed Icc3 and Icc4 limit from 20mA to 30mA (Standby Current)	January 31, 2003	Preliminary
1.0	Fixed PART NAME TABLE AC ELECTRICAL CHARACTERISTICS (2)TIMING CHARACTERISTICS Changed tKHKL limit from 1.8ns to 2.0ns. Changed tKLKH limit from 1.8ns to 2.0ns. Changed all Setup times from 1.2ns to 1.0ns. Changed all Hold times from 0.5ns to 0.8ns. STRUCTURE OF IDENTIFICATION REGISTER Fixed JEDEC Vender Code as follows. The semiconductor operations of HITACHI and MITSUBISHI Electric were transferred to RENESAS Technology Corporation on April 1st 2003. Both RENESAS and MITSUBISHI JEDEC vendor code are as follows	August 1, 2003	Preliminary

Bit No.	11	10	9	8	7	6	5	4	3	2	1
RENESAS	0	1	0	0	0	1	0	0	0	1	1
MITSUBISHI	0	0	0	0	0	0	1	1	1	0	0

Renesas Technology Corp.

Keep safety first in your circuit designs!

- Renesas Technology Corporation puts the maximum effort into making semiconductor products better and more reliable, but there is always the possibility that trouble may occur with them. Trouble with semiconductors may lead to personal injury, fire or property damage. Remember to give due consideration to safety when making your circuit designs, with appropriate measures such as (i) placement of substitutive, auxiliary circuits, (ii) use of nonflammable material or (iii) prevention against any malfunction or mishap.

Notes regarding these materials

- These materials are intended as a reference to assist our customers in the selection of the Renesas Technology Corporation product best suited to the customer's application; they do not convey any license under any intellectual property rights, or any other rights, belonging to Renesas Technology Corporation or a third party.
- Renesas Technology Corporation assumes no responsibility for any damage, or infringement of any third-party's rights, originating in the use of any product data, diagrams, charts, programs, algorithms, or circuit application examples contained in these materials.
- All information contained in these materials, including product data, diagrams, charts, programs and algorithms represents information on products at the time of publication of these materials, and are subject to change by Renesas Technology Corporation without notice due to product improvements or other reasons. It is therefore recommended that customers contact Renesas Technology Corporation or an authorized Renesas Technology Corporation product distributor for the latest product information before purchasing a product listed herein.
The information described here may contain technical inaccuracies or typographical errors.
Renesas Technology Corporation assumes no responsibility for any damage, liability, or other loss rising from these inaccuracies or errors.
Please also pay attention to information published by Renesas Technology Corporation by various means, including the Renesas Technology Corporation Semiconductor home page (<http://www.renesas.com>).
- When using any or all of the information contained in these materials, including product data, diagrams, charts, programs, and algorithms, please be sure to evaluate all information as a total system before making a final decision on the applicability of the information and products. Renesas Technology Corporation assumes no responsibility for any damage, liability or other loss resulting from the information contained herein.
- Renesas Technology Corporation semiconductors are not designed or manufactured for use in a device or system that is used under circumstances in which human life is potentially at stake. Please contact Renesas Technology Corporation or an authorized Renesas Technology Corporation product distributor when considering the use of a product contained herein for any specific purposes, such as apparatus or systems for transportation, vehicular, medical, aerospace, nuclear, or undersea repeater use.
- The prior written approval of Renesas Technology Corporation is necessary to reprint or reproduce in whole or in part these materials.
- If these products or technologies are subject to the Japanese export control restrictions, they must be exported under a license from the Japanese government and cannot be imported into a country other than the approved destination.
Any diversion or reexport contrary to the export control laws and regulations of Japan and/or the country of destination is prohibited.
- Please contact Renesas Technology Corporation for further details on these materials or the products contained therein.
