NOTICE

1. The information contained herein can change without notice owing to product and/or technical improvements. Before using the product, please make sure that the information being referred to is up-to-date.

2. The outline of action and examples for application circuits described herein have been chosen as an explanation for the standard action and performance of the product. When planning to use the product, please ensure that the external conditions are reflected in the actual circuit, assembly, and program designs.

3. When designing your product, please use our product below the specified maximum ratings and within the specified operating ranges including, but not limited to, operating voltage, power dissipation, and operating temperature.

4. Oki assumes no responsibility or liability whatsoever for any failure or unusual or unexpected operation resulting from misuse, neglect, improper installation, repair, alteration or accident, improper handling, or unusual physical or electrical stress including, but not limited to, exposure to parameters beyond the specified maximum ratings or operation outside the specified operating range.

5. Neither indemnity against nor license of a third party's industrial and intellectual property right, etc. is granted by us in connection with the use of the product and/or the information and drawings contained herein. No responsibility is assumed by us for any infringement of a third party's right which may result from the use thereof.

6. The products listed in this document are intended for use in general electronics equipment for commercial applications (e.g., office automation, communication equipment, measurement equipment, consumer electronics, etc.). These products are not authorized for use in any system or application that requires special or enhanced quality and reliability characteristics nor in any system or application where the failure of such system or application may result in the loss or damage of property, or death or injury to humans.

   Such applications include, but are not limited to, traffic and automotive equipment, safety devices, aerospace equipment, nuclear power control, medical equipment, and life-support systems.

7. Certain products in this document may need government approval before they can be exported to particular countries. The purchaser assumes the responsibility of determining the legality of export of these products and will take appropriate and necessary steps at their own expense for these.

8. No part of the contents contained herein may be reprinted or reproduced without our prior permission.

Preface

This manual describes the hardware of Oki's original CMOS 4-bit microcontroller ML63295A.

Refer to the "nX-4/250, 300 Core Instruction Manual" for details of the 4-bit CPU core nX-4/250 which is built in the ML63295A.

The manuals related to the ML63295A are shown below.

- nX-4/250, 300 Core Instruction Manual:
  Describes the base architecture and instruction set of nX-4/250 core and nX-4/300 core.

- SASM63K User's Manual:
  Describes the structured assembler operation and assembler language specification.

- Dr.63295 User's Manual:
  Describes the hardware of the emulator.

- DT63K Debugger/DTS63K Simulator User's Manual:
  Describes the debugger commands and the hardware of the simulator.

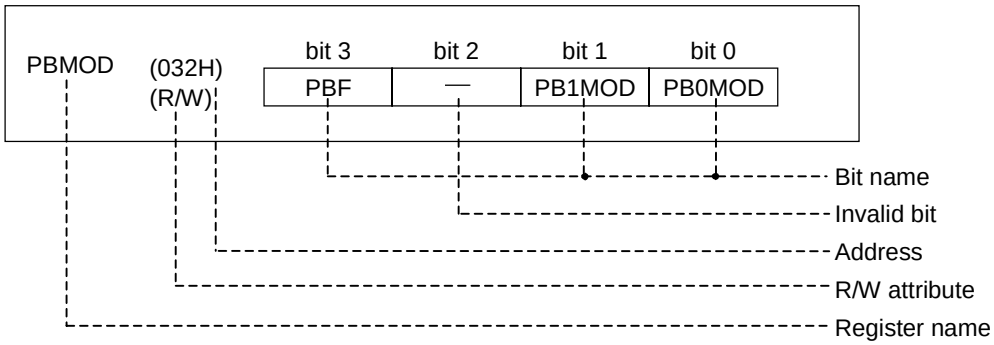
This document is subject to change without notice.

Notation

Classification	Notation	Description
■ Numeric value	xxh, xxH	Represents a hexadecimal number.
	xxb	Represents a binary number.
■ Unit	word, W	1 word = 16 bits
	byte, B	1 byte = 2 nibbles = 8 bits
	nibble, N	1 nibble = 4 bits
	mega-, M	10^6
	kilo-, K	$2^{10} = 1024$
	kilo-, k	$10^3 = 1000$
	milli-, m	10^{-3}
	micro-, µ	10^{-6}
	nano-, n	10^{-9}
	second, s (lower case)	second
	KB	1 KB = 1 kilobyte = 1024 bytes
	MB	1 MB = 1 megabyte = 2^{20} bytes = 1,048,576 bytes
■ Symbol	⚠ Note:	Gives more information about mistakable items.
■ Terminology	"H" level	Indicates high side voltage signal levels V_{IH} and V_{OH} as specified by the electrical characteristics.
	"L" level	Indicates low side voltage signal levels V_{IL} and V_{OL} as specified by the electrical characteristics.

■ Register description

Invalid bit : When read, a value of "1" is always obtained. Write operations are invalid.
R/W attribute : "R" indicates data can be read and "W" indicates data can be written.



Contents

Chapter 1

Overview

1. Overview

1.1 Overview

The ML63295A is a CMOS 4-bit microcontroller that employs Oki's original CPU core nX-4/250.

The ML63295A operates on a power supply voltage of 6 V.

With built-in 3072-dot matrix LCD drivers (96 SEG. × 32 COM.), the ML63295A is suited for applications such as electronic dictionaries with an LCD.

1.2 Features

The ML63295A has the following features.

a. Extensive instruction set
- 439 instructions
  Transfer, rotate, increment/decrement, arithmetic operations, compare, logic operations, mask operations, bit operations, ROM table reference, external memory transfer, stack operations, flag operations, jump, conditional branch, call/return, control

b. Wide variety of addressing modes
- Indirect addressing mode for 4 types of data memory with current bank register, extra bank register, HL register and XY register
- Data memory bank internal direct addressing mode

c. Processing speed
- 2 clocks per machine cycle, with most instructions executed in 1 machine cycle
- Minimum instruction execution time: 61 µs (@ 32.768 kHz system clock)
  1 µs (@ 2 MHz system clock)

d. Clock generation circuit
- Low-speed clock:
  Crystal oscillation or RC oscillation selected with mask option (30 kHz to 80 kHz)
- High-speed clock:
  Ceramic oscillation or RC oscillation selected with software (2 MHz max.)

e. Program memory space
- 32K words
- The basic instruction length is 16 bits per word.

f. Data memory space
- 2048 nibbles

g. External data memory space
- 64 Kbytes (expandable furthermore by using the I/O ports)

h. Stack level
- Call stack level: 16 levels
- Register stack level: 16 levels

i. Ports

- Input ports:
  Selectable as input with pull-up resistor/input with pull-down resistor/high impedance input.
- Output ports:
  Selectable as P-channel open drain output/N-channel open drain output/high-impedance output/CMOS output.
- I/O ports:
  Selectable as input with pull-up resistor/input with pull-down resistor/high impedance input.
  Selectable as P-channel open drain output/N-channel open drain output/high impedance output/CMOS output.
- Can be interfaced with external peripherals that use a different power supply than this device uses (provided with V_{DDI} as the port-dedicated power supply pin and V_{DDE} as the power supply for the MD and MDB pins).
- Number of ports:
  Input port: 2 ports × 4 bits
  Output port: 6 ports × 4 bits
  Input-output port: 6 ports × 4 bits

j. Melody output

- Melody frequency: 529 Hz to 2979 Hz
- Tone length: 63 varieties
- Tempo: 15 varieties
- Melody data: Stored in program memory
- Buzzer driver signal output: 4 kHz

k. LCD driver

- Number of segments: 3072 Max. (96 SEG. × 32 COM.)
- Duty: Selectable as 1/2, 1/4, 1/6, 1/8, 1/10, 1/12, 1/14, 1/16, 1/18, 1/20, 1/22, 1/24, 1/26, 1/28, 1/30, or 1/32 duty
- Bias: Selectable as 1/5 or 1/6 bias (regulator built-in)
- Frame frequency: ex. 64 Hz (at 1/32 duty), 128 Hz (at 1/16 duty), 256 Hz (at 1/8 duty), 512 Hz (at 1/4 duty), 1024 Hz (at 1/2 duty)
- Contrast: 16 levels adjustable
- Display modes: Selectable as all-ON mode/all-OFF mode/power down mode/normal display mode

l. Multiplication/division circuit

- Multiplication: (8 bits) × (8 bits) → Product (16 bits)
- Division: (16 bits)/(8 bits) → Quotient (16 bits), Remainder (8 bits)

m. System reset function

- System reset through RESET pin
- System reset by power-on detection
- System reset by low-speed oscillation halt

n. Battery check

- Low-voltage supply check
- The value of the judgment voltage is selected by the software (by setting the LD1 and LD0 bits of BLDCON)

LD1	LD0	Judgment voltage (V)	Remarks
1	0	4.5 ±0.1	Ta = 25°C
1	1	5.1 ±0.1	Ta = 25°C

o. Timers and counter

- 8-bit timer: 2
  Selectable as auto-reload mode/clock frequency measurement mode
- Watchdog timer: 1
- 100 Hz timer: 1
  Measurable in steps of 1/100 sec.
- 15-bit time-base counter: 1
  1, 2, 4, 8, 16, 32, 64, and 128 Hz signals can be read

p. Serial port

- Mode: Selectable as UART mode, synchronous mode
- UART communication speed: 1200 bps, 2400 bps, 4800 bps, 9600 bps
- Clock frequency in synchronous mode: Internal clock mode (32.768 kHz), external clock frequency
- Data length: 5 to 8 bits

q. Shift register

- Shift clock: 1 × or 1/2 × System clock, external clock
- Data length: 8 bits

r. Interrupt factors

- External interrupt: 5
- Internal interrupt: 12

s. Operating temperature: –20 to +70°C

t. Power supply voltage: 3.5 to 7.2 V

u. Package:

- Chip (212 pads): (Product name: ML63295A-xxxWA)
- 240-pin plastic QFP (QFP240-P-3232-0.50-BK4): (Product name: ML63295A-xxxGA) … under consideration
  xxx indicates the code number.

1.3 Function List

Table 1-1 lists the ML63295A functions. The solid black circles within the chart indicate that the product has the particular function.

Table 1-1 Function List

Function		Symbol	ML63295A	Reference page
ROM (× 16 bits)		ROM	3276	→2-7
RAM (× 4 bits)		RAM	2048	→2-8
STACK RAM	Call	STACK	16 levels	→2-5
	Register		16 levels	→2-6
System reset generation circuit		RST	●	→3-2
Interrupt		INT	●	→4-1
Clock generator circuit		OSC	●	→5-1
Time base counter		TBC	●	→6-1
Timers		TIMER	● (2ch)	→7-1
100 Hz timer counter		100HzTC	●	→8-1
Watchdog timer		WDT	●	→9-1
Input port		INPUT PORT	2 ports × 4 bits	—
	Port 0	P0	●	→10-2
	Port 1	P1	●	→10-2
Output port		OUTPUT PORT	6 ports × 4 bits	—
	Port 2	P2	●	→10-9
	Port 3	P3	●	
	Port 4	P4	●	→10-13
	Port 5	P5	●	
	Port 6	P6	●	
	Port 7	P7	●	
I/O port		I/O PORT	6 ports × 4 bits	—
	Port 8	P8	●	→10-21
	Port 9	P9	●	
	Port A	PA	●	
	Port B	PB	●	→10-30
	Port C	PC	●	→10-37
	Port E	PE	●	→10-45
External memory interface		EXTMEM	●	→11-1
Melody driver		MELODY	●	→12-1
Serial port		SIO	●	→13-1
Shift register		SFT	●	→14-1
LCD driver	COM	LCD	32 lines	→15-1
	SEG		96 lines	
Display register (× 4 bits)		DSPR	768	→15-4
Bias generator		BIAS	●	→15-6
Multiplication/division circuit		MULDIV	●	→16-1
Battery low detect circuit		BLD	●	→17-1
Power supply circuit		POWER	●	→18-1

1.4 Block Diagram

Asterisks (*) indicate port secondary functions. Signal names enclosed by chain lines (·····) indicate interface signals of the V_{DDI} power supply system. Signal names enclosed by ▭ indicate signals of the V_{DDE} power supply system.

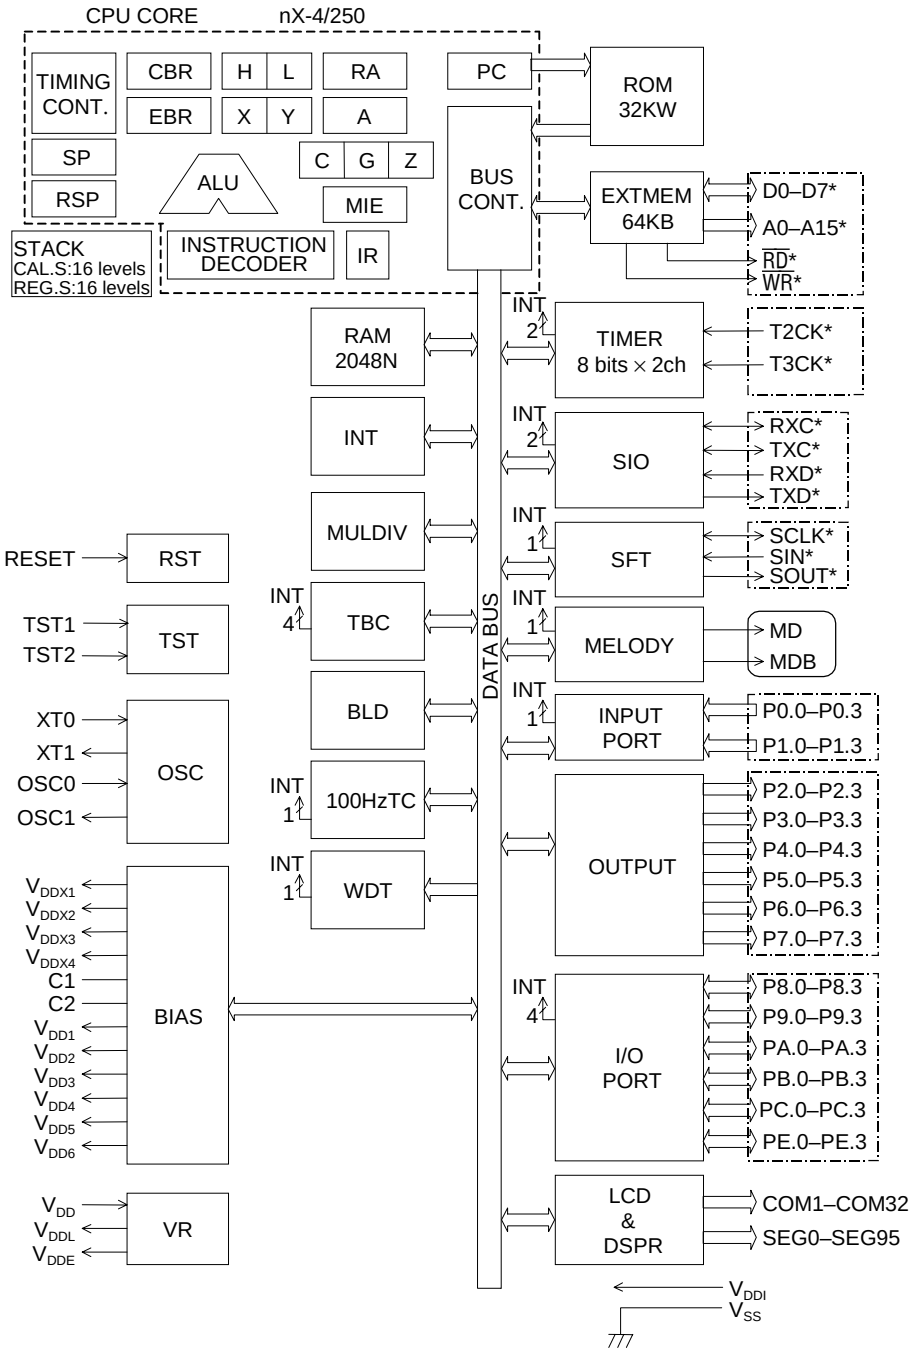


Figure 1-1 ML63295A Block Diagram

1.5 Pin Configuration

1.5.1 Pin Configuration

The ML63295A pin configuration, chip pin configuration, and pad coordinates are shown in Figures 1-2, 1-3, and Table 1-2, respectively.

NC (not connected) indicates an unused pin that is left unconnected (open).

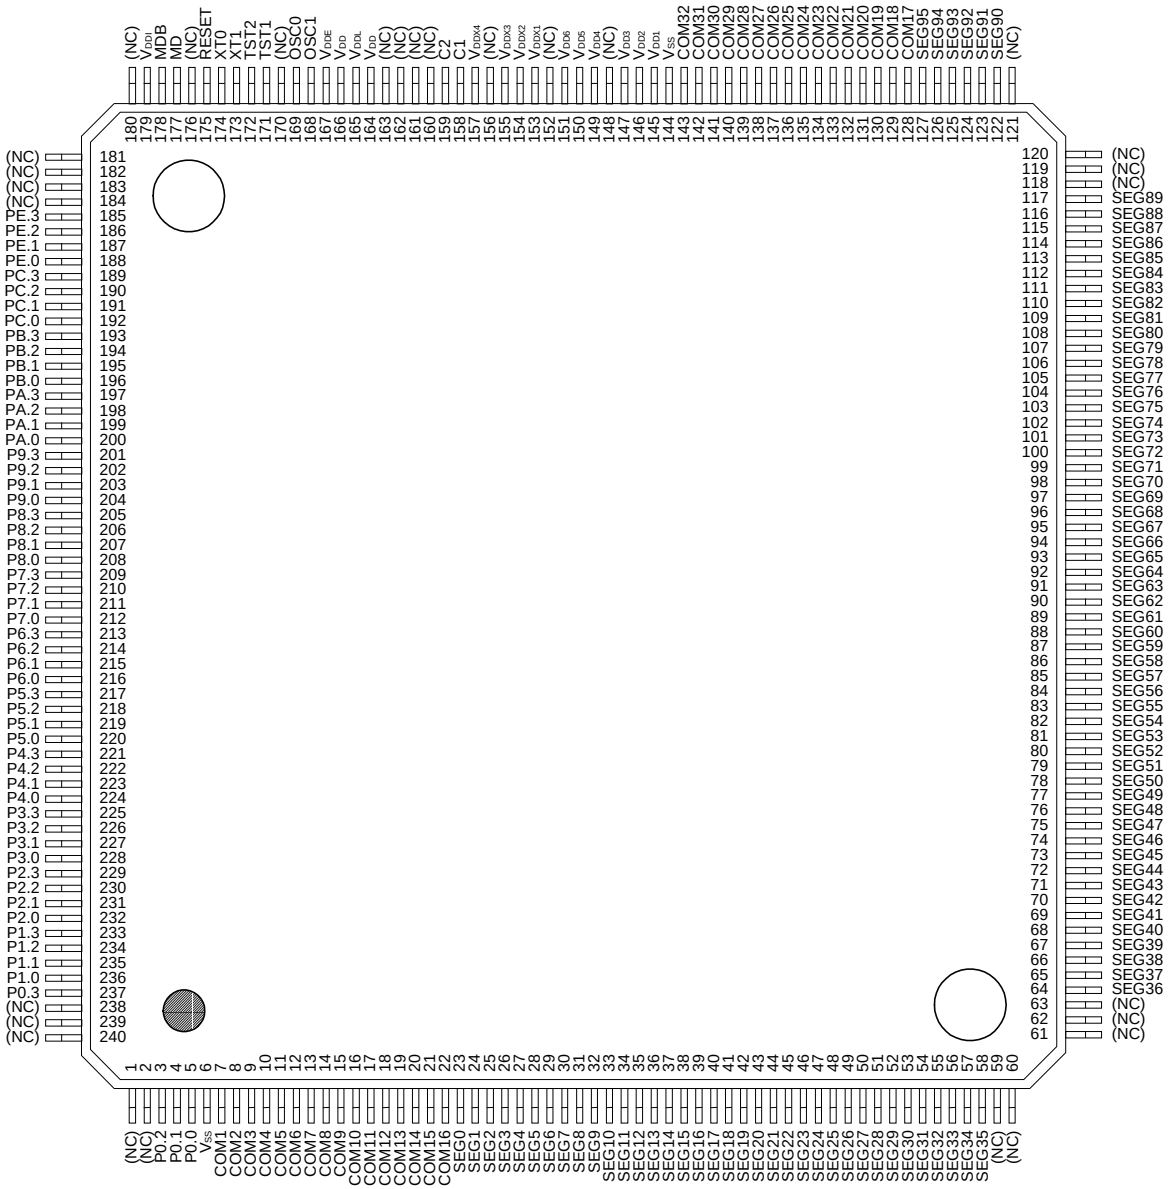

Figure 1-2 ML63295A 240-Pin QFP Pin Configuration (Top View)
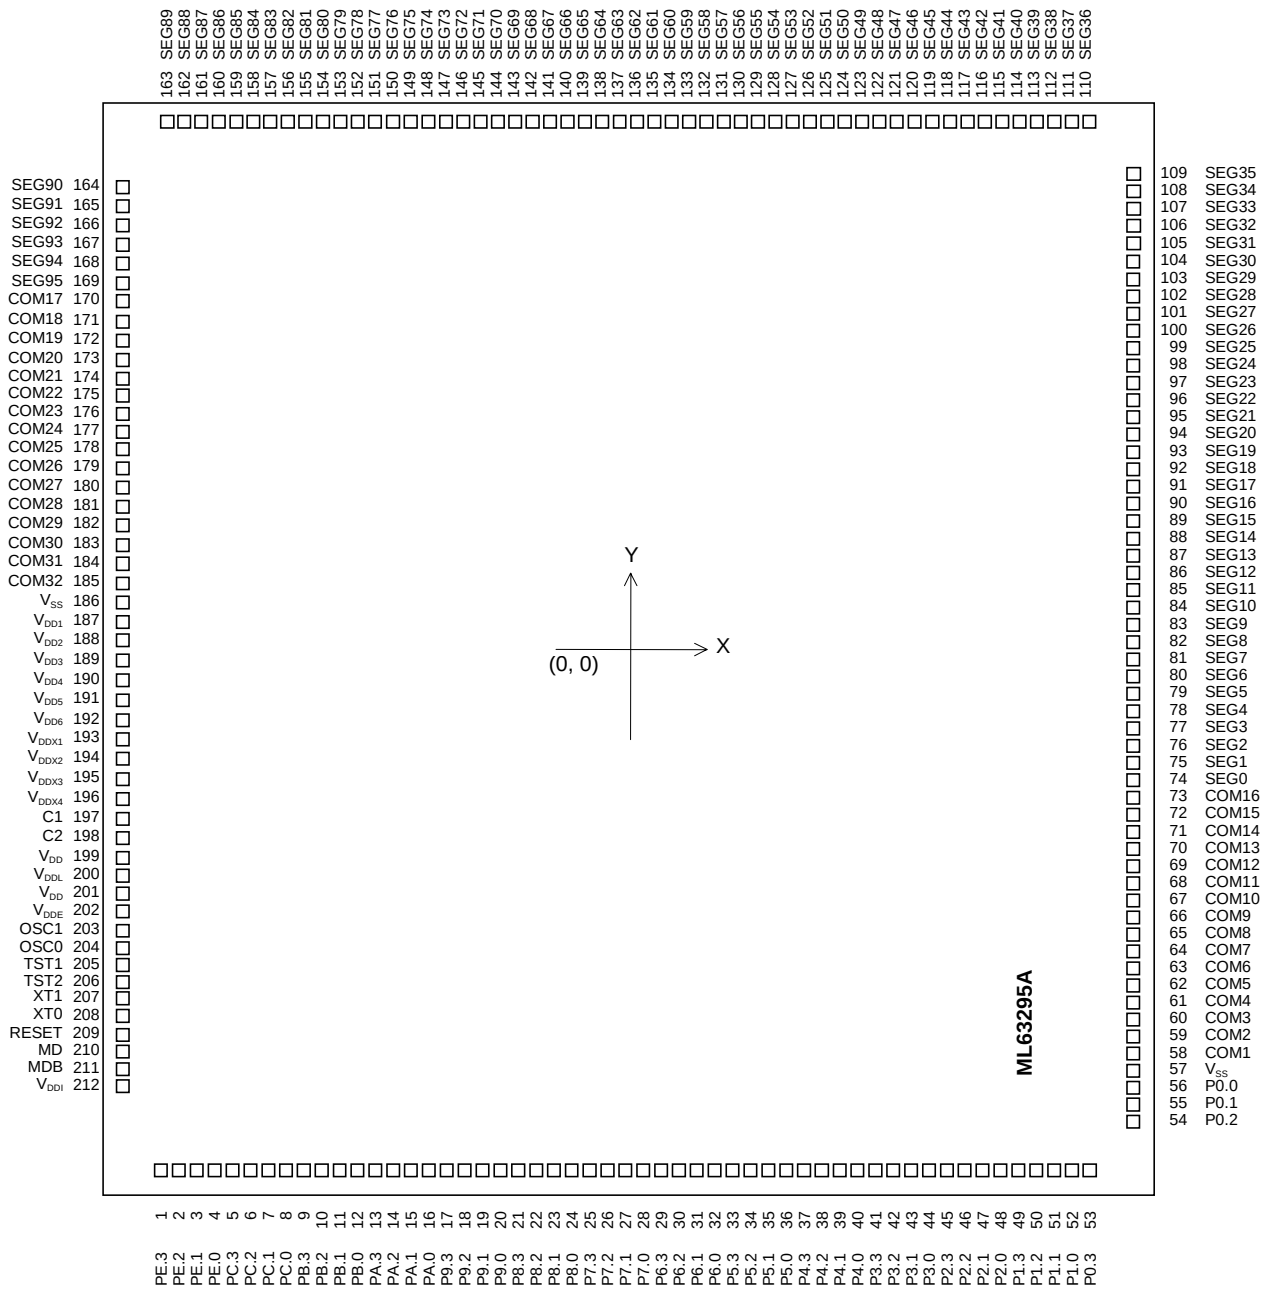
(GA: QFP240-P-3232-0.50-BK4)



- Chip size : 8.25 mm × 8.20 mm
- Chip thickness : 350 μm (280 μm: available as required)
- Coordinate origin : center of chip
- Pad hole size : 100 μm × 100 μm
- Pad size : 110 μm × 110 μm
- Minimum pad pitch : 120 μm

Note: The chip substrate voltage is V_{SS}.

1.6 Pin Descriptions

1.6.1 Descriptions of the Basic Functions of Each Pin

The basic functions of each pin of the ML63295A are listed in Table 1-3. Use of a slash ("/") in a pin name indicates that the pin has a secondary function. Refer to section 1.6.2, "Descriptions of the Secondary Functions of Each Pin."

In the I/O column, "—" indicates a power supply pin, "I" indicates an input pin, "O" indicates an output pin, and "I/O" indicates an input/output pin.

Table 1-3 Pin Description (Basic Functions)

Classification	Pin name	Pin No.	Pad No.	I/O	Function
Power supply	V_{DD}	164, 166	199, 201	—	Positive power supply pin
	V_{SS}	6, 144	57, 186	—	Negative power supply pin
	V_{DD1}	145	187	—	Power supply pins for LCD bias voltage (internally generated): Capacitors (1.0 μF) should be connected between these pins and V_{SS}.
	V_{DD2}	146	188		
	V_{DD4}	149	190		
	V_{DD5}	150	191		
	V_{DD6}	151	192		
	V_{DDX1}	153	193	—	Positive power supply for low-speed oscillation.
	V_{DD3}	147	189	—	Power supply pins for LCD bias voltage generation: Capacitors (1.0 μF) should be connected between these pins and V_{SS}.
	V_{DDX4}	157	196		
	C1	158	197	—	Capacitor connection pins for LCD bias voltage generation: A capacitor (1.0 μF) should be connected between C1 and C2, and between V_{DDX2} and V_{DDX3}.
	C2	159	198		
	V_{DDX2}	154	194	—	
	V_{DDX3}	155	195		
	V_{DDI}	179	212	—	Positive power supply pin for external interface (Power supply for input, output, and input-output ports)
	V_{DDL}	165	200	—	Positive power supply pin for internal logic (internally generated): A capacitor (0.1 μF) should be connected between this pin and V_{SS}.
	V_{DDE}	167	202	—	Constant voltage output pin: A capacitor (1.0 μF) should be connected between this pin and V_{SS}.
Oscillator	XT0	174	208	I	Low-speed clock oscillation pins: An option for using crystal oscillation or RC oscillation is chosen by the mask option. If the crystal oscillation is chosen, a crystal should be connected between XT0 and XT1, and capacitor (C_G) should be connected between XT0 and V_{SS}. If the RC oscillation is chosen, external oscillation resistor (R_{OSL}) should be connected between XT0 and XT1.
	XT1	173	207	O	
	OSC0	169	204	I	High-speed clock oscillation pins: Either a ceramic resonator and capacitors (C_{L0}, C_{L1}) or an external oscillation resistor (R_{OSH}) should be connected to these pins.
	OSC1	168	203	O	

Table 1-3 Pin Description (Basic Functions) (continued)

Classification	Pin name	Pin No.	Pad No.	I/O	Function
Test	TST1	171	205	I	Input pins for testing: A pull-down resistor is internally connected to these pins.
	TST2	172	206	I	
Reset	RESET	175	209	I	System reset input pin: Setting this pin to "H" level puts this device into a reset state. Then, setting this pin to "L" level starts executing an instruction from address 0000H. A pull-down resistor is internally connected to this pin.
Melody	MD	177	210	O	Melody output pin (non-inverted output)
	MDB	178	211	O	Melody output pin (inverted output)
Port	P0.0/INT5	5	56	I	4-bit input ports: Each bit can be selected as the following. • Input with pull-up resistor • Input with pull-down resistor • High-impedance input
	P0.1/INT5	4	55		
	P0.2/INT5	3	54		
	P0.3/INT5	237	53		
	P1.0/INT5	236	52	I	
	P1.1/INT5	235	51		
	P1.2/INT5	234	50		
	P1.3/INT5	233	49		
	P2.0	232	48	O	4-bit output ports: P-channel open drain output, N-channel open drain output, CMOS output, or high-impedance output is selectable for each bit.
	P2.1	231	47		
	P2.2	230	46		
	P2.3	229	45		
	P3.0	228	44	O	
	P3.1	227	43		
	P3.2	226	42		
	P3.3	225	41		
	P4.0/A0	224	40	O

1.6.2 Descriptions of the Secondary Functions of Each Pin

The secondary functions of each pin of the ML63295A are listed in Table 1-4.

Table 1-4 Pin Description (Secondary Functions)

Classification	Pin name	Pin No.	Pad No.	I/O	Function
External interrupt	PB.0/INT0	196	12	I	External interrupt 0 input pins: The change of input signal level causes an interrupt to occur. The Port B Interrupt Enable register (PBIE) enables or disables an interrupt for each bit.
	PB.1/INT0	195	11		
	PB.2/INT0	194	10		
	PB.3/INT0	193	9		
	PC.0/INT1	192	8	I	External interrupt 1 input pins: The change of input signal level causes an interrupt to occur. The Port C Interrupt Enable register (PCIE) enables or disables an interrupt for each bit.
	PC.1/INT1	191	7		
	PC.2/INT1	190	6		
	PC.3/INT1	189	5		
	PE.3/INT2	185	1	I	External interrupt 2 input pin: The change of input signal level causes an interrupt to occur.
	P8.3/INT4	205	21	I	External interrupt 4 input pin: The change of input signal level causes an interrupt to occur.
	P0.0/INT5	5	56	I	External interrupt 5 input pins: The change of input signal level causes an interrupt to occur. The Port 0 Interrupt Enable register (P0IE) and Port 1 Interrupt Enable register (P1IE) enable or disable an interrupt for each bit.
	P0.1/INT5	4	55		
	P0.2/INT5	3	54		
	P0.3/INT5	237	53		
	P1.0/INT5	236	52		
	P1.1/INT5	235	51		
	P1.2/INT5	234	50		
	P1.3/INT5	233	49		
Timer	PB.2/T2CK	194	10	I	External clock input pin for timer 2
	PB.3/T3CK	193	9	I	External clock input pin for timer 3

Table 1-4 Pin Description (Secondary Functions) (continued)

Classification	Pin name	Pin No.	Pad No.	I/O	Function
Serial port	PC.0/RXD	192	8	I	Serial port receive data input pin
	PC.1/TXC	191	7	I/O	Sync serial port clock input-output pin: Transmit clock output when this device is used as a master processor. Transmit clock input when this device is used as a slave processor.
	PC.2/RXC	190	6	I/O	Sync serial port clock input-output pin: Receive clock output when this device is used as a master processor. Receive clock input when this device is used as a slave processor.
	PC.3/TXD	189	5	O	Serial port transmit data output pin
Shift register	PE.0/SIN	188	4	I	Shift register receive data input pin
	PE.1/SOUT	187	3	O	Shift register transmit data output pin
	PE.2/SCLK	186	2	I/O	Shift register clock input-output pin: Clock output when this device is used as a master processor. Clock input when this device is used as a slave processor.
External memory	P4.0/A0	224	40	O	Address output bus for external memory
	P4.1/A1	223	39		
	P4.2/A2	222	38		
	P4.3/A3	221	37		
	P5.0/A4	220	36		
	P5.1/A5	219	35		
	P5.2/A6	218	34		
	P5.3/A7	217	33		
	P6.0/A8	216	32		
	P6.1/A9	215	31		
	P6.2/A10	214	30		
	P6.3/A11	213	29		
	P7.0/A12	212	28		
	P7.1/A12	211	27		
	P7.2/A14	210	26		
	P7.3/A15	209	25		
	P9.0/D0	204	20	I/O	Data bus for external memory
	P9.1/D1	203	19		
	P9.2/D2	202	18		
	P9.3/D3	201	17		
	PA.0/D4	200	16		
	PA.1/D5	199	15		
	PA.2/D6	198	14		
	PA.3/D7	197	13		
	P8.0/$\overline{RD}$	208	24	O	Read signal output pin for external memory (negative logic)
	P8.1/$\overline{WR}$	207	23	O	Write signal output pin for external memory (negative logic)

1.6.3 Handling of Unused Pins

Table 1-5 shows how unused pins should be handled.

Table 1-5 Handling of Unused Pins

Pin	Recommended pin handling
OSC0, OSC1	Open
C1, C2	Open
V_{DD1}, V_{DD2}, V_{DD3}, V_{DD4}, V_{DD5}, V_{DD6}	Open
V_{DDX2}, V_{DDX3}, V_{DDX4}	Open
TST1, TST2	Open or connect to V_{SS}
P0.0–P0.3	Open
P1.0–P1.3	Open
P2.0–P2.3	Open
P3.0–P3.3	Open
P4.0–P4.3	Open
P5.0–P5.3	Open
P6.0–P6.3	Open
P7.0–P7.3	Open
P8.0–P8.3	Open
P9.0–P9.3	Open
PA.0–PA.3	Open
PB.0–PB.3	Open
PC.0–PC.3	Open
PE.0–PE.3	Open
MD, MDB	Open
COM1–COM32	Open
SEG0–SEG95	Open

Notes:

1. If a pin set as a high impedance input is left unconnected, the supply current may become excessive. Therefore, it is recommended that unused input ports and input/output ports be set as inputs with either a pull-down or pull-up resistor.
2. When test pins TST1 and TST2 are left unconnected, malfunction may result if there is a large amount of external noise. Therefore, it is recommended to permanently connect TST1 and TST2 to V_{SS}.
3. Connect a capacitor (0.1 µF) between the V_{DDX1} pin and the V_{SS} pin when the LCD drivers are not used.

1.7 Basic Timing

1.7.1 Basic Timing of CPU Operation

The low-speed oscillation clock from the XT0/XT1 pins or the high-speed oscillation clock from the OSC0/OSC1 pins are used without frequency division as the system clock (CLK). The system clock signal is in phase with the signal from the XT1 pin or the OSC1 pin.

As shown in Figure 1-4, a single machine cycle is composed of two states, S1 and S2. One state is the interval from a falling edge of CLK to the falling edge of the next CLK.

Instructions are processed in machine cycle units and each instruction is executed in 1 to 3 machine cycles. Instructions are classified according to the number of machine cycles: 1-machine-cycle instructions (M1), 2-machine-cycle instructions (M1 + M2), and 3-machine-cycle instructions (M1 + M2 + M3).

Most instructions are executed in 1 machine cycle.

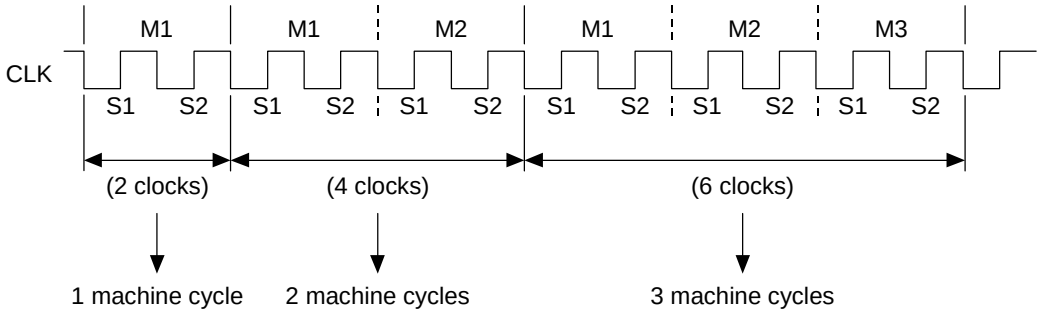

Figure 1-4 Clock Configuration of Each Machine Cycle

1.7.2 Port I/O Basic Timing

Figure 1-5 shows the basic I/O timing.

During the execution of an instruction that outputs data to a port, setting data (data A) is output at the rising edge of the clock in the S2 state during the machine cycle of that instruction.

During the execution of an instruction that inputs data from a port, data at the input pin (data B) is captured internally while the clock is at a "H" level in the S1 state during the machine cycle of that instruction. That data is transferred to the accumulator at the start of the next machine cycle.

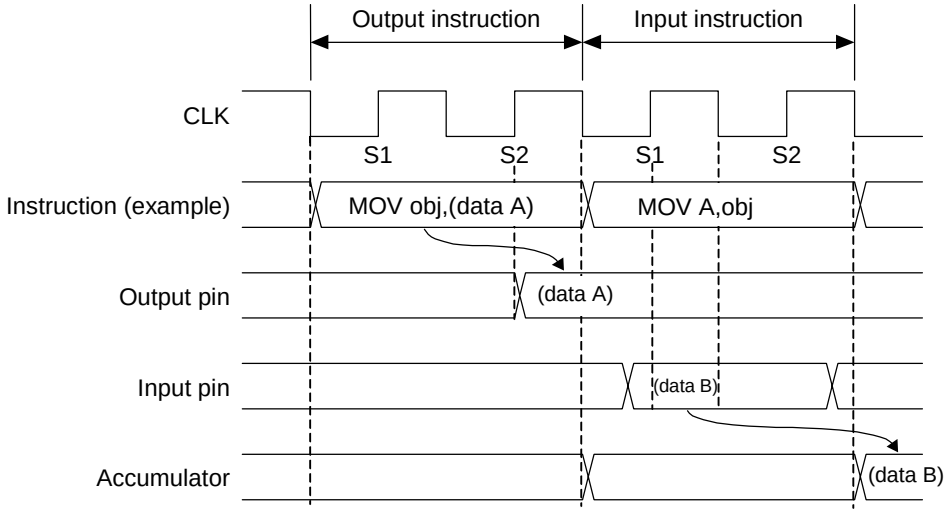

Figure 1-5 Port I/O Basic Timing

Note:

Regarding input signals

"0" will be captured in the internal register if a "L" level is input to the input pin even once (① of Figure 1-6) during the data capture interval.

"1" will be captured in the internal register only if a "H" level is maintained (② of Figure 1-6) throughout the data capture interval.

Therefore, if noise occurs in the input data, implement noise reduction measures with the program and peripheral devices.

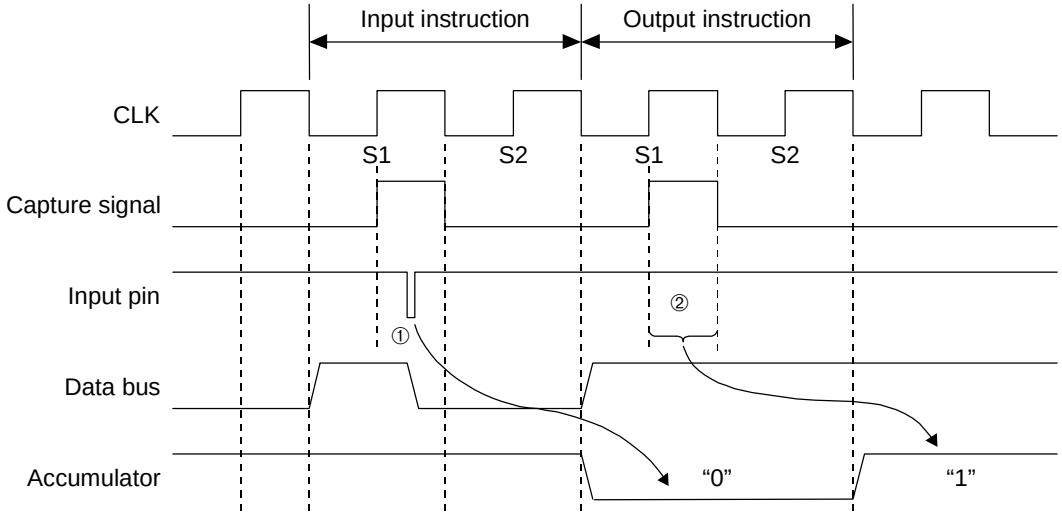

Figure 1-6 Input Data Example

1.7.3 Interrupt Basic Timing

Figure 1-7 shows the basic interrupt timing.

As shown in the figure, when an interrupt factor is generated, the interrupt factor is sampled at the falling edge of CLK and an interrupt request (IRQ) is set at the first half of S1.

When an interrupt condition is established and the CPU receives an interrupt, the interrupt routine will start beginning from the next machine cycle.

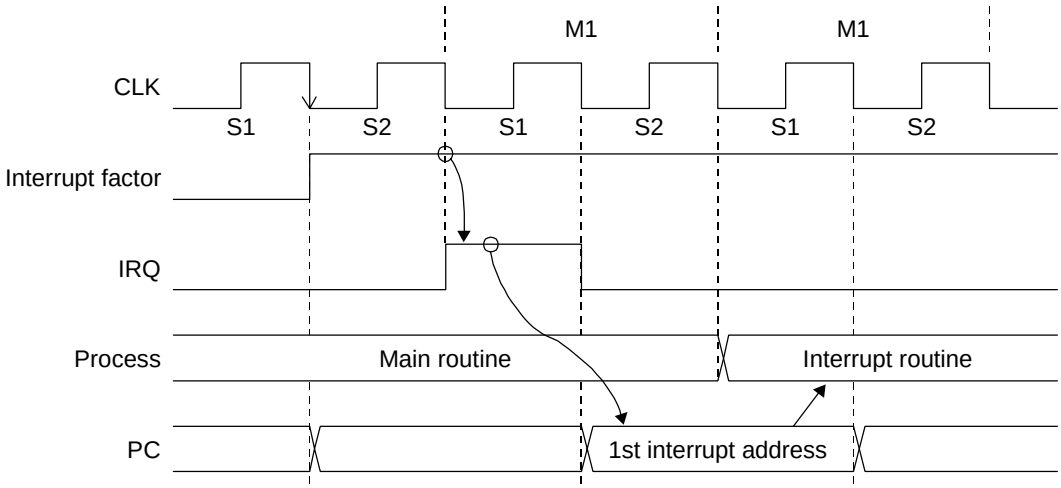

Figure 1-7 Interrupt Basic Timing

Chapter 2

CPU and Memory Spaces

2. CPU and Memory Spaces

2.1 Overview

The ML63295A is equipped with Oki's original CPU core nX-4/250.

The instruction set of the nX-4/250 core consists of 439 types of instructions.

The memory space consists of a 16-bit wide program memory space and a 4-bit wide data memory space. A stack for saving the program counter during a subroutine call or interrupt (call stack) and a stack for saving registers during a PUSH instruction (register stack) are provided separately from the memory space.

The program memory space is used for program data, ROM table data and melody note data.

In the data memory space, special function registers (SFRs) are located in BANK 0, the LCD display register (DSPR) in BANKS 1 to 3, and data RAM in BANKS 4 to 11.

2.2 Registers

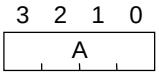
The nX-4/250 core processes data mainly with the accumulator and register set.

The register set is a programming model consisting of the HL and XY registers that store data memory addresses, the current bank register (CBR), the extra bank register (EBR), the RA register that stores program memory addresses, registers that control program flow, and registers that control flags and memory.

2.2.1 Accumulator (A)

The accumulator (A) is the central register for various arithmetic operations.

At system reset, the accumulator is initialized to "0". When an interrupt occurs, a "PUSH HL" instruction can be used if necessary to save the accumulator on the register stack. The accumulator can be restored with a "POP HL" instruction.



Accumulator

2.2.2 Flag Register

The flag register consists of 3 flags: the carry flag (C), the zero flag (Z) and the G flag (G). When an interrupt occurs, a "PUSH HL" instruction can be used if necessary to save the flag register on the register stack. The flag register can be restored with a "POP HL" instruction.

Flag register

2.2.2.1 Carry Flag (C)

The carry flag (C) is a 1-bit flag that is loaded with a carry during addition or a borrow during subtraction. At system reset, the carry flag is initialized to "0".

2.2.2.2 Zero Flag (Z)

The zero flag (Z) is a 1-bit flag that is set to "1" when the contents of the accumulator (A) are loaded with "0H". The zero flag is set to "0" when the contents of the accumulator (A) are loaded with a value other than "0H". However, the XCH instruction does not change the zero flag. At system reset, the zero flag is initialized to "0".

2.2.2.3 G Flag (G)

The G flag (G) changes to "1" when the HL, XY or RA registers overflow as the result of execution of a post-increment register indirect addressing instruction or as the result of an increment instruction for the HL, XY or RA registers. At system reset, the G flag is initialized to "0".

2.2.3 Master Interrupt Enable Flag (MIE)

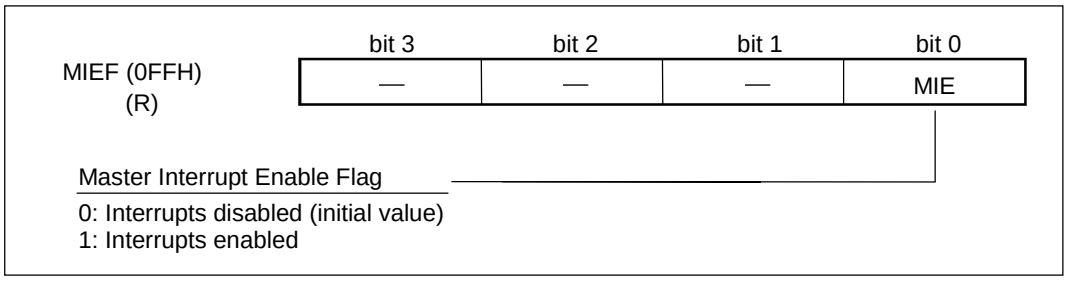
MIE (bit 0 of MIEF) is a flag that disables or enables all interrupts except for the watchdog timer interrupt. MIEF is a 4-bit register in which bit 0 is the master interrupt enable flag (MIE).

If MIE is "0", all interrupts are disabled. If MIE is "1", all interrupts are enabled (with the exception of the watchdog timer).

When any interrupt is received, MIE is cleared to "0". MIE is set to "1" by execution of a return from interrupt instruction (RTI instruction).

If multi-level interrupt processing is to be performed, execute a RTI instruction (MIE←"1") during the interrupt processing routines.

At system reset, MIE is initialized to "0". MIEF only supports data reference (R) of data memory through addressing instructions.



Note:

When setting MIE, use "EI" instructions (MIE← "1") and "DI" instructions (MIE← "0").

2.2.4 Current Bank Register (CBR), Extra Bank Register (EBR), HL Register (HL), XY Register (XY)

The CBR, EBR, HL, and XY registers are used for indirect addressing of data memory.

The CBR and EBR registers indicate the data memory bank. The HL and XY registers indicate addresses in the bank. CBR is also used in combination with 8-bit data in the instruction code for direct addressing within the current bank.

Figure 2-1 shows the various register combinations.

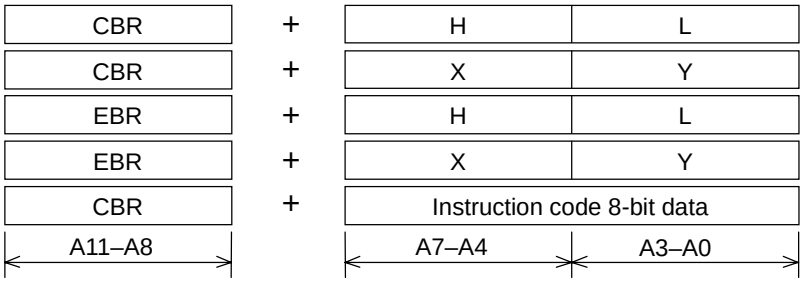


Figure 2-1 Various Register Combinations

A11 to A0 in Figure 2-1 indicate data memory addresses (4K nibbles max.).

At system reset, the CBR, EBR, HL, and XY registers are initialized to "0".

When an interrupt occurs, a "PUSH HL" or "PUSH XY" instruction can be used if necessary to save the CBR, EBR, HL, and XY registers on the register stack. These registers can be restored with a "POP HL" or "POP XY" instruction.

The CBR, EBR, HL, and XY registers are assigned to special function register (SFR) addresses 0F9H to 0FEH.

		bit 3	bit 2	bit 1	bit 0
EBR	(0FEH) (R/W)	e_3	e_2	e_1	e_0
CBR	(0FDH) (R/W)	c_3	c_2	c_1	c_0
H	(0FCH) (R/W)	h_3	h_2	h_1	h_0
L	(0FBH) (R/W)	l_3	l_2	l_1	l_0
X	(0FAH) (R/W)	x_3	x_2	x_1	x_0
Y	(0F9H) (R/W)	y_3	y_2	y_1	y_0

2.2.5 Program Counter (PC)

The program counter (PC) is a counter with 16 valid bits that specifies the program memory space.

2.2.6 RA Registers (RA3, RA2, RA1, RA0)

The RA registers are used for indirect program memory addressing (ROM table reference instructions).

Figure 2-2 shows the address configuration of the RA registers.

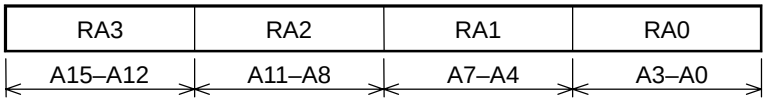

Figure 2-2 Address Configuration of RA3 to RA0 Registers

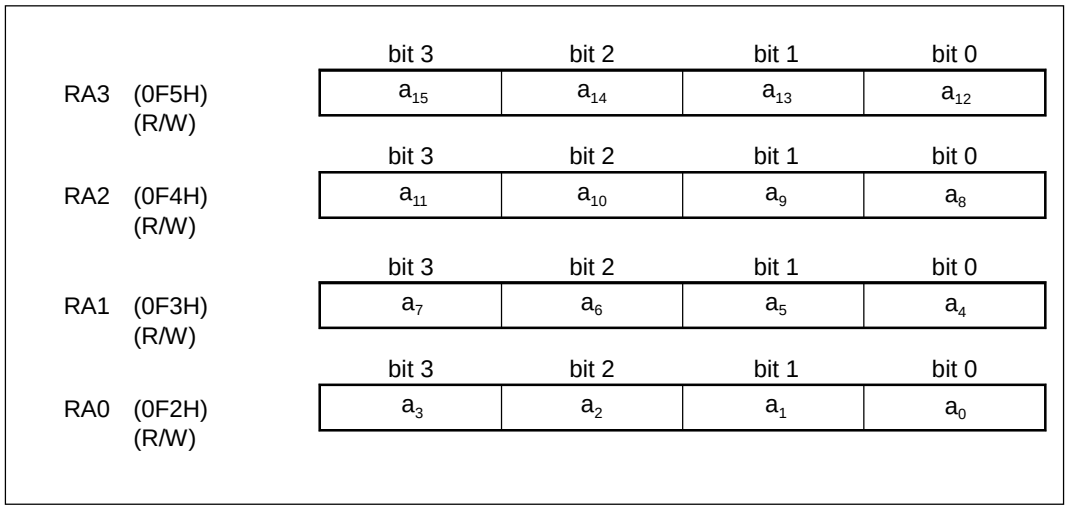
Within the A15 to A0 of Figure 2-2, A14 to A0 indicate program memory addresses (32K words max.).

RA3 to RA0 are assigned to special function register (SFR) addresses 0F2H to 0F5H.



At system reset, RA3 to RA0 are initialized to "0".

Note:

When executing a ROM table reference instruction that uses RA registers, do not use addresses located in the SFR area to transfer ROM table data to RA registers, otherwise indirect addressing of program memory will not operate properly.

2.2.7 Stack Pointer (SP) and Call Stack

The stack pointer (SP) is a pointer that indicates the call stack address where the program counter is saved when a subroutine call or interrupt occurs.

The SP is a 4-bit up/down counter that is incremented during stack saves and is decremented during stack restores.

The call stack has 16 levels from address 0H to address 0FH. Because the hardware requires 1 level of the call stack during program execution, only 15 levels can be used for stack saves. The contents of the call stack cannot be read or written by the program.

Figure 2-3 shows the relation between SP and the call stack.

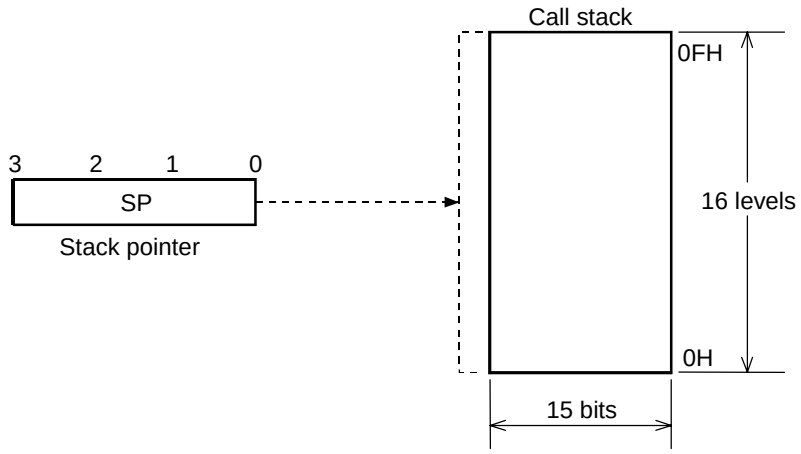


Figure 2-3 Relation between SP and Call Stack

SP is assigned to special function register (SFR) address 0F7H.

	bit 3	bit 2	bit 1	bit 0
SP (0F7H) (R)	SP3	SP2	SP1	SP0

At system reset, SP is initialized to "0" and points to address "0H" of the call stack. SP is a read-only register and writes are invalid.

2.2.8 Register Stack Pointer (RSP) and Register Stack

The register stack pointer (RSP) is a pointer that indicates the register stack address for saving various registers.

RSP is a 4-bit up/down counter that is incremented during stack saves (execution of PUSH instructions) and is decremented during stack restores (execution of POP instructions).

The register stack has 16 levels from address 0H to address 0FH. The contents of the register stack cannot be read or written by the program.

Figure 2-4 shows the relation between RSP and the register stack.

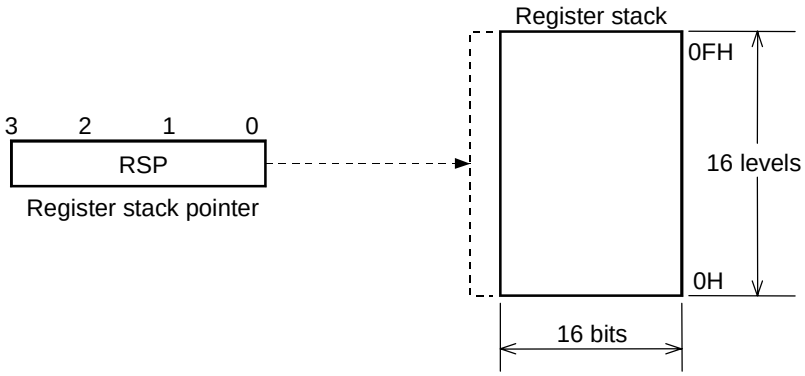

Figure 2-4 Relation between RSP and Register Stack

The various registers shown in Figure 2-5 are saved onto and restored from the register stack by PUSH and POP instructions.

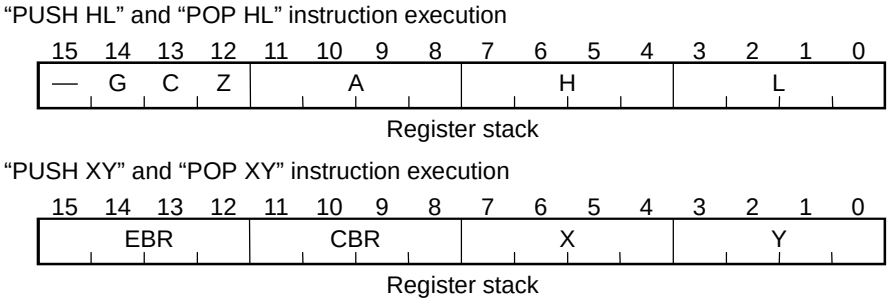

Figure 2-5 Register Save/Restore by Execution of PUSH/POP Instructions

RSP is assigned to special function register (SFR) address 0F6H.

	bit 3	bit 2	bit 1	bit 0
RSP (0F6H) (R/W)	rsp3	rsp2	rsp1	rsp0

At system reset, RSP is initialized to "0" and points to address "0H" of the register stack.

2.3 Memory Spaces

2.3.1 Program Memory Space

The program memory space is the read-only memory that stores program data.

The program memory space has a data length of 16 bits and extends from address 0000H to address 7FFFH.

In addition to program data, the program memory can also store ROM table data and the melody data. Figure 2-6 shows the configuration of the program memory space.

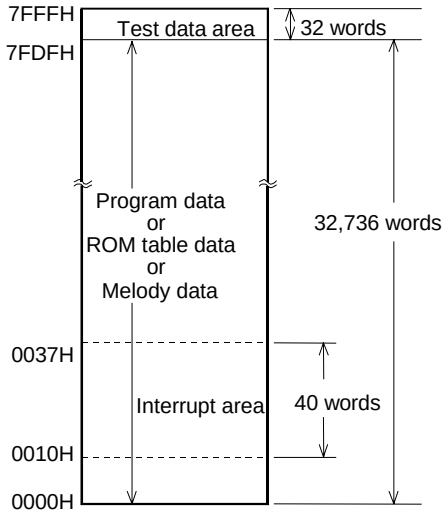

Figure 2-6 Program Memory Space Configuration

After system reset, instruction execution begins at address 0000H. The interrupt area from address 0010H to address 0037H contains starting addresses of the interrupt processing routines that are executed when interrupts are generated. (Refer to Chapter 4, "Interrupt".)

ROM table data is transferred to data memory by ROM table reference instructions.

The melody data defines the tone, tone length, and end tone used in the melody circuit of the ML63295A. After an MSA instruction specifies the starting address, the melody data is automatically transferred to the melody circuit when a melody data interrupt occurs. (Refer to Chapter 12, "Melody Driver".)

Because the test data area contains program data for testing, it cannot be used as a program data area.

2.3.2 Data Memory Space

The data memory space contains data RAM and special function registers (SFRs).

The data memory consists of 10 banks. One bank unit is 256 nibbles. BANK 0 is allocated as a SFR area, BANKS 1 to 3 as the LCD display register, and BANK 4 and the following BANKS are data RAM.

Figure 2-7 shows the configuration of the data memory space.

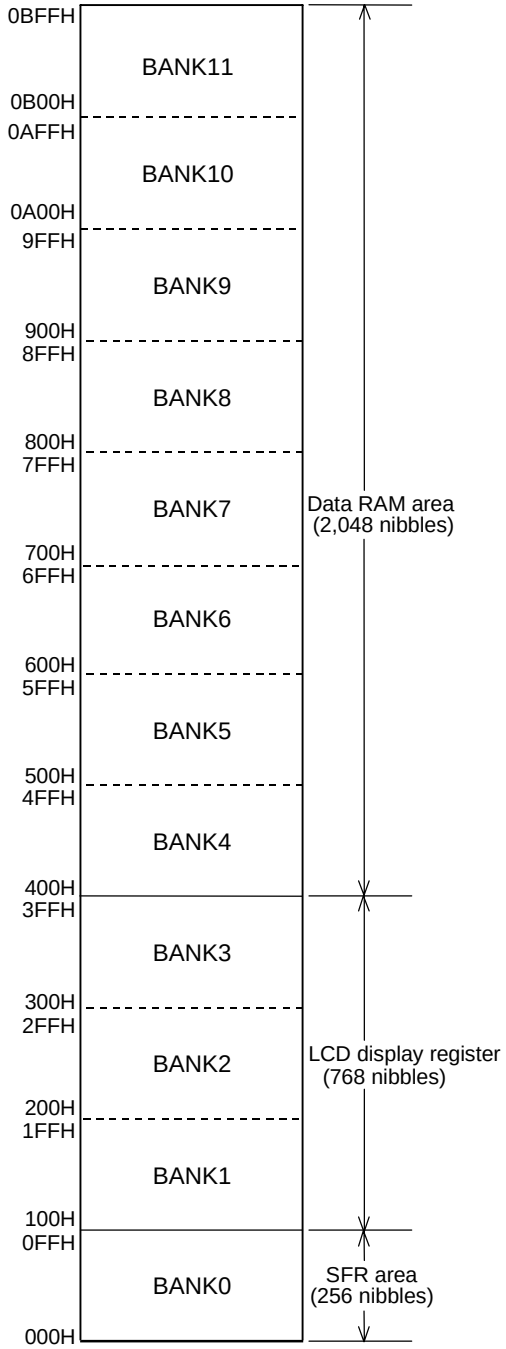

Figure 2-7 Data Memory Space Configuration

2.3.3 External Memory Space

The external memory space has an 8-bit data length, allocated from address 0 to address 0FFFFH.

See Chapter 11 "External Memory Interface".

It is configured as indicated in Figure 2-8.

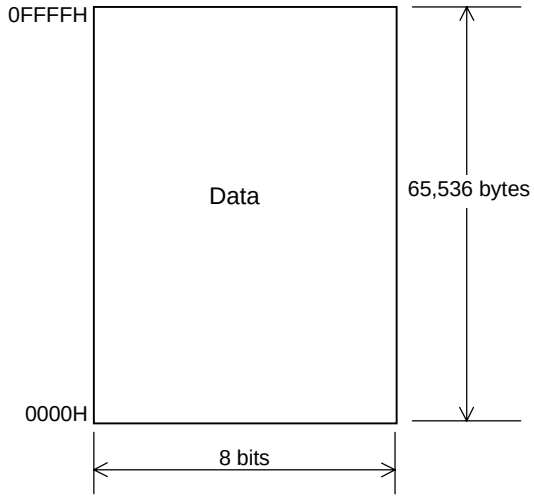

Figure 2-8 External Memory Space Configuration

Chapter 3

CPU Control Functions

3. CPU Control Functions

3.1 Overview

Operating states, including system reset, are classified as follows.

- Normal operation mode
- System reset mode
- Halt mode

Figure 3-1 shows the CPU operating state transition diagram.

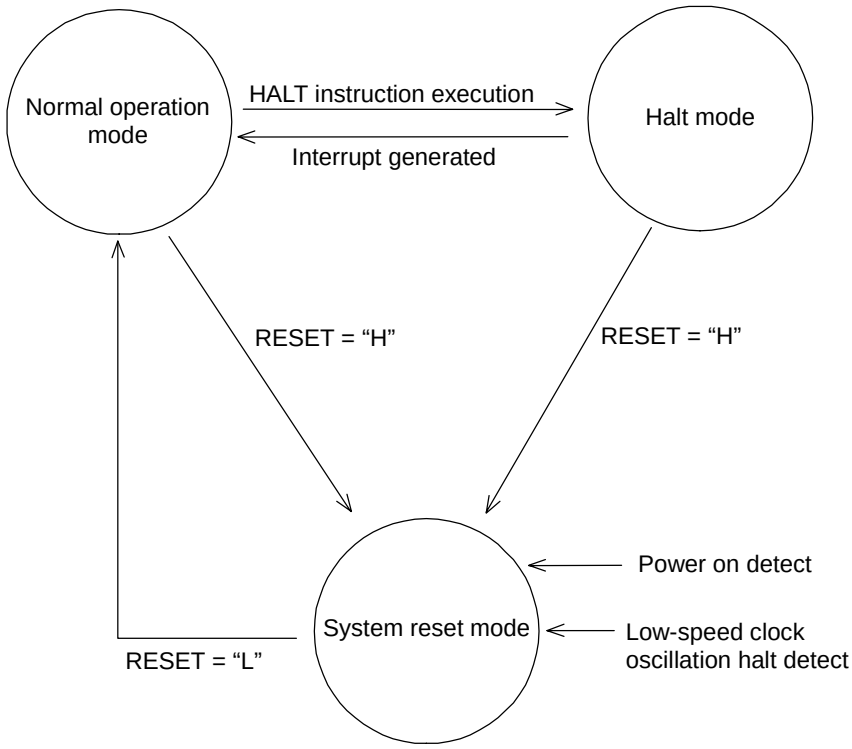

Figure 3-1 Operating State Transition Diagram

The normal operation mode is the state in which the CPU executes instructions sequentially.

The system reset mode begins when a reset input causes the CPU to begin system reset processing where registers and pins are initialized. The CPU remains in this state until instruction execution begins. After system reset processing, instruction execution begins from address 0000H.

The halt mode is the state in which the CPU is halted (instruction execution suspended) but internal peripheral functions continue to operate. During the halt mode, the PC is not incremented. Even upon entering the halt mode, port and peripheral functions will not change. Transfer to the halt mode is accomplished by executing a "HALT" instruction.

3.2 System Reset Mode (RST)

3.2.1 Transfer to and State of System Reset Mode

The following three factors cause a transfer to the system reset mode.

- Setting the RESET pin to a "H" level
- Detection of power on
- Detection of a low-speed clock oscillation halt

The following operations are performed in the system reset mode.

(1) CPU is initialized.
(2) Backup flag changes to "1" and backup circuit changes to ON state.
(3) Bias reference voltage supply (VR) is energized.
(4) All LCD driver outputs are turned OFF and the outputs change to the V_{SS} level.
(5) All special function registers (SFRs) are initialized. However, data RAM and display registers are not initialized.

After system reset processing, instruction execution begins from address 0000H.

Figure 3-2 shows the system reset generator circuit and Figure 3-3 shows the signals when a system reset is generated.

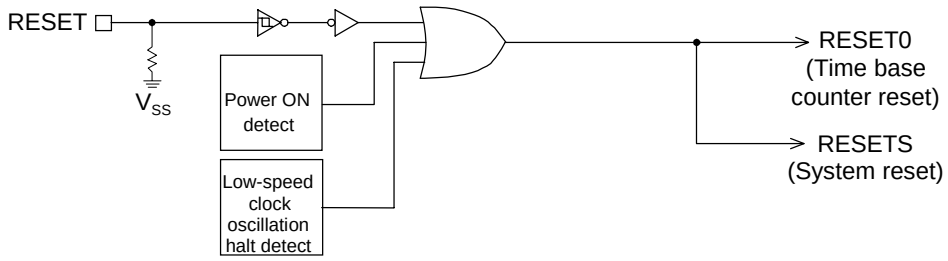

Figure 3-2 System Reset Generator Circuit

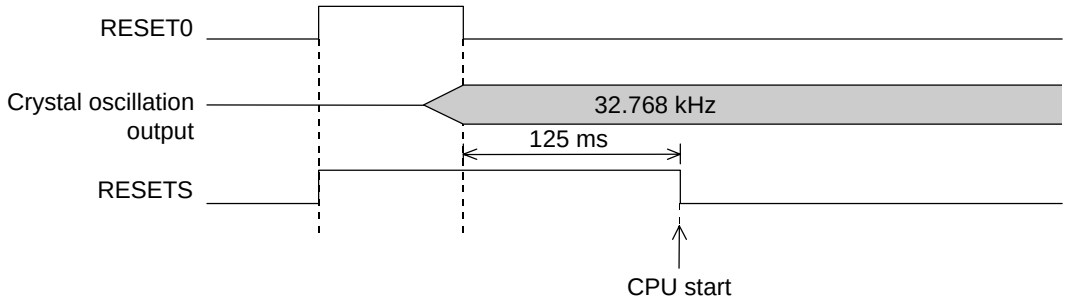

Figure 3-3 Signals When System Reset is Generated

Note:

System reset takes priority over all other processing and terminates all processing up to that point in time. Therefore, the contents of RAM and display registers, which are not initialized, cannot be guaranteed after a system reset.

3.3 Halt Mode

3.3.1 Transfer to and State of Halt Mode

Transfer to the halt mode is performed by the software when a HALT instruction is executed.

When a HALT instruction is executed, the CPU enters the HALT mode at the S2 state of the HALT instruction.

Oscillation and time base counter operation continue while in the halt mode.

If an interrupt request occurs at the same time as execution of a HALT instruction, interrupt processing has priority and the HALT instruction will not be executed. After the HALT instruction performs the equivalent operation of a NOP instruction, the interrupt routine is entered. When an RTI instruction is used to complete the interrupt routine, the main routine is resumed beginning from the instruction immediately following the HALT instruction.

Figure 3-4 shows the timing when a HALT instruction and interrupt request occur simultaneously.

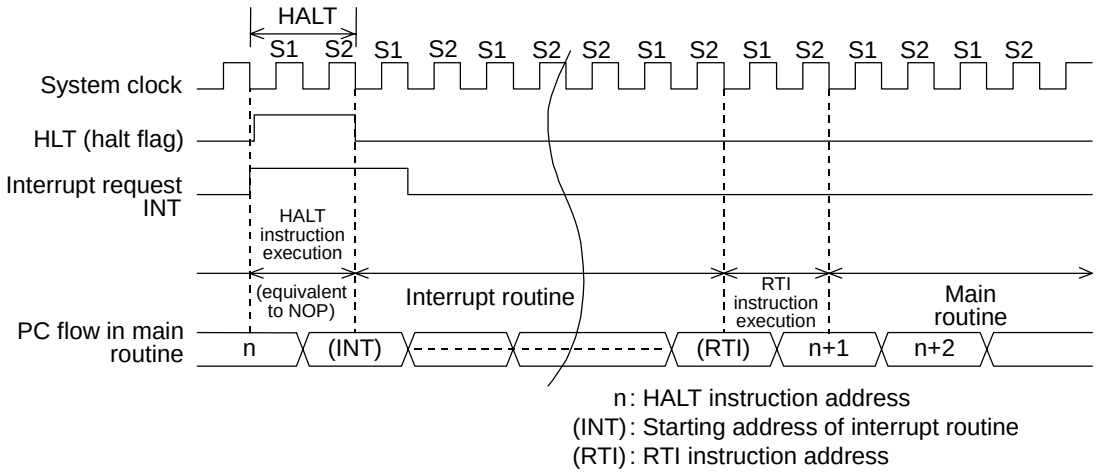

Figure 3-4 Timing of Simultaneous HALT Instruction and Interrupt Request

Note:

While an interrupt request is generated, execution of a HALT instruction will not transfer operation to the halt mode.

3.3.2 Halt Mode Release

The following two methods are available to release the halt mode.

- Release by interrupt generation (transfer to normal operation mode)
- Release by RESET pin (transfer to system reset mode)

3.3.2.1 Release of Halt Mode by Interrupt

If the halt mode is to be released by an interrupt, the enable flag of the interrupt used for release must be set to "1" prior to entering the halt mode. When the halt mode is released by an interrupt, operation transfers to the normal operation mode.

Figure 3-5 shows the timing of transferring to the halt mode by execution of a HALT instruction and of releasing the halt mode by an interrupt.

When the halt mode is released by an interrupt request, the first instruction immediately following the HALT instruction is executed and then the interrupt routine is entered. When an RTI instruction is used to complete the interrupt routine, the main routine is resumed beginning from the second instruction after the HALT instruction.

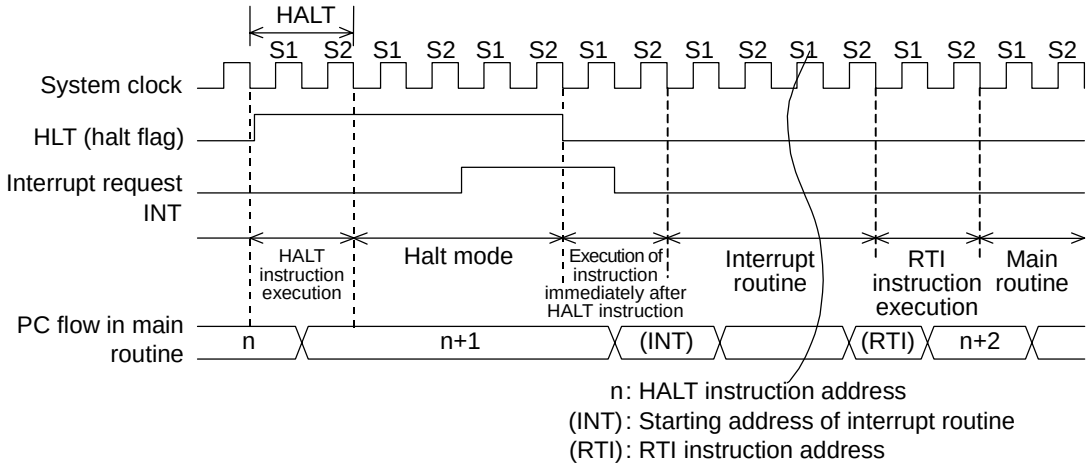

Figure 3-5 Timing of Transfer to Halt Mode and Release of Halt Mode by Interrupt

Note:

If the halt mode is to be released, set individual interrupt enable flags to "1". If an individual interrupt enable flag is "0", the corresponding interrupt request signal cannot reset the HLT flag, regardless of whether the master interrupt enable flag (MIE) is "0" or "1".

3.3.2.2 Release of Halt Mode by RESET Pin

If a high-level is input to the RESET pin, the CPU is released from the halt mode and transfers to the system reset mode.

3.3.3 Melody Data Interrupt and Halt Mode Release

The halt mode is not released by a melody data interrupt.

The melody data interrupt is different from a conventional interrupt in that the melody data interrupt is a hardware processing interrupt used for transfer of melody data to the melody circuit. It is not dependent on the program.

When this interrupt is generated, the instruction immediately after the HALT instruction is executed, then the melody data is transferred to the melody circuit, and the HALT instruction is executed again. This sequence is indicated in Figure 3-6.

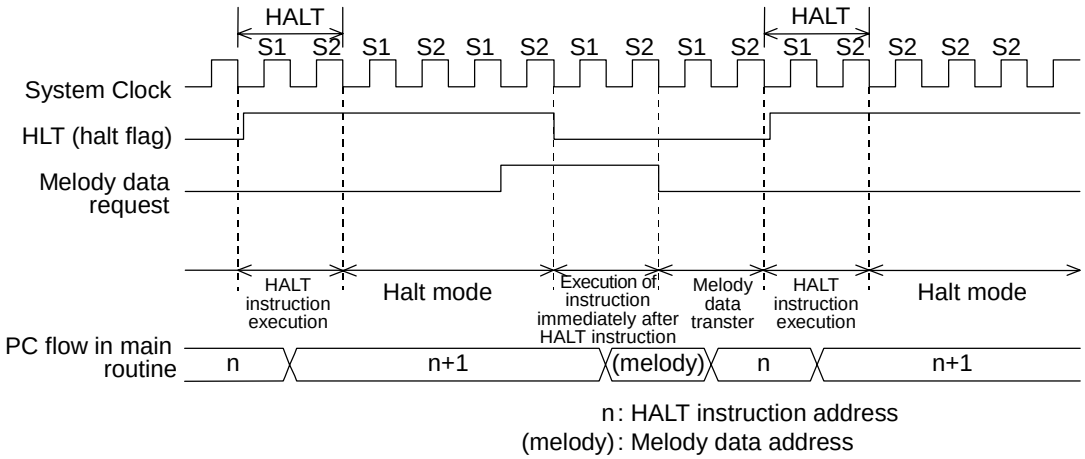

Figure 3-6 Melody Data Request Interrupt Operation

3.3.4 Note Concerning HALT Instruction

As described above, the instruction immediately after the HALT instruction may be executed any number of times. For this reason, always place an NOP instruction immediately after the HALT instruction.

Chapter 4

Interrupt (INT)

4. Interrupt (INT)

4.1 Overview

The ML63295A supports 17 interrupt factors: 5 external interrupts and 12 internal interrupts.

With the exception of the watchdog timer interrupt, interrupt enable/disable is controlled by the master interrupt enable flag (MIE) and the individual interrupt enable registers (IE0 to IE4). Watchdog timer interrupt is a non-maskable interrupt.

When interrupt conditions are met, the interrupt routine is executed from the interrupt start address.

Table 4-1 indicates a list of interrupt factors, and Figure 4-1 shows the interrupt control equivalent circuit.

Table 4-1 Interrupt Factors

Priority	Interrupt factor	Symbol	Interrupt start address
1	Watchdog timer interrupt	WDTINT	0010H
2	Melody end interrupt	MDINT	0012H
3	External interrupt 0 (PB 4-bit OR input)	XI0INT	0014H
4	External interrupt 1 (PC 4-bit OR input)	XI1INT	0016H
5	External interrupt 2 (PE.3)	XI2INT	0018H
6	External interrupt 4 (P8.3)	XI4INT	001CH
7	External interrupt 5 (P0 4-bit OR input)	XI5INT	001EH
8	Timer 2 interrupt	TM2INT	0024H
9	Timer 3 interrupt	TM3INT	0026H
10	Serial port receive interrupt	SRINT	0028H
11	Serial port transmit interrupt	STINT	002AH
12	Shift register interrupt	SFTINT	002CH
13	T10 Hz interrupt	T10HzINT	002EH
14	32 Hz interrupt	32HzINT	0030H
15	16 Hz interrupt	16HzINT	0032H
16	4 Hz interrupt	4HzINT	0034H
17	2 Hz interrupt	2HzINT	0036H

If multiple interrupts are detected simultaneously, the lowest interrupt start address is given priority.

For details on interrupt operation, refer to Chapter 6 (Time Base Counter), Chapter 7 (Timers), Chapter 8 (100 Hz Timer Counter), Chapter 9 (Watchdog Timer), Chapter 10 (Ports), Chapter 12 (Melody Driver), Chapter 13 (Serial Port), and Chapter 14 (Shift Register).

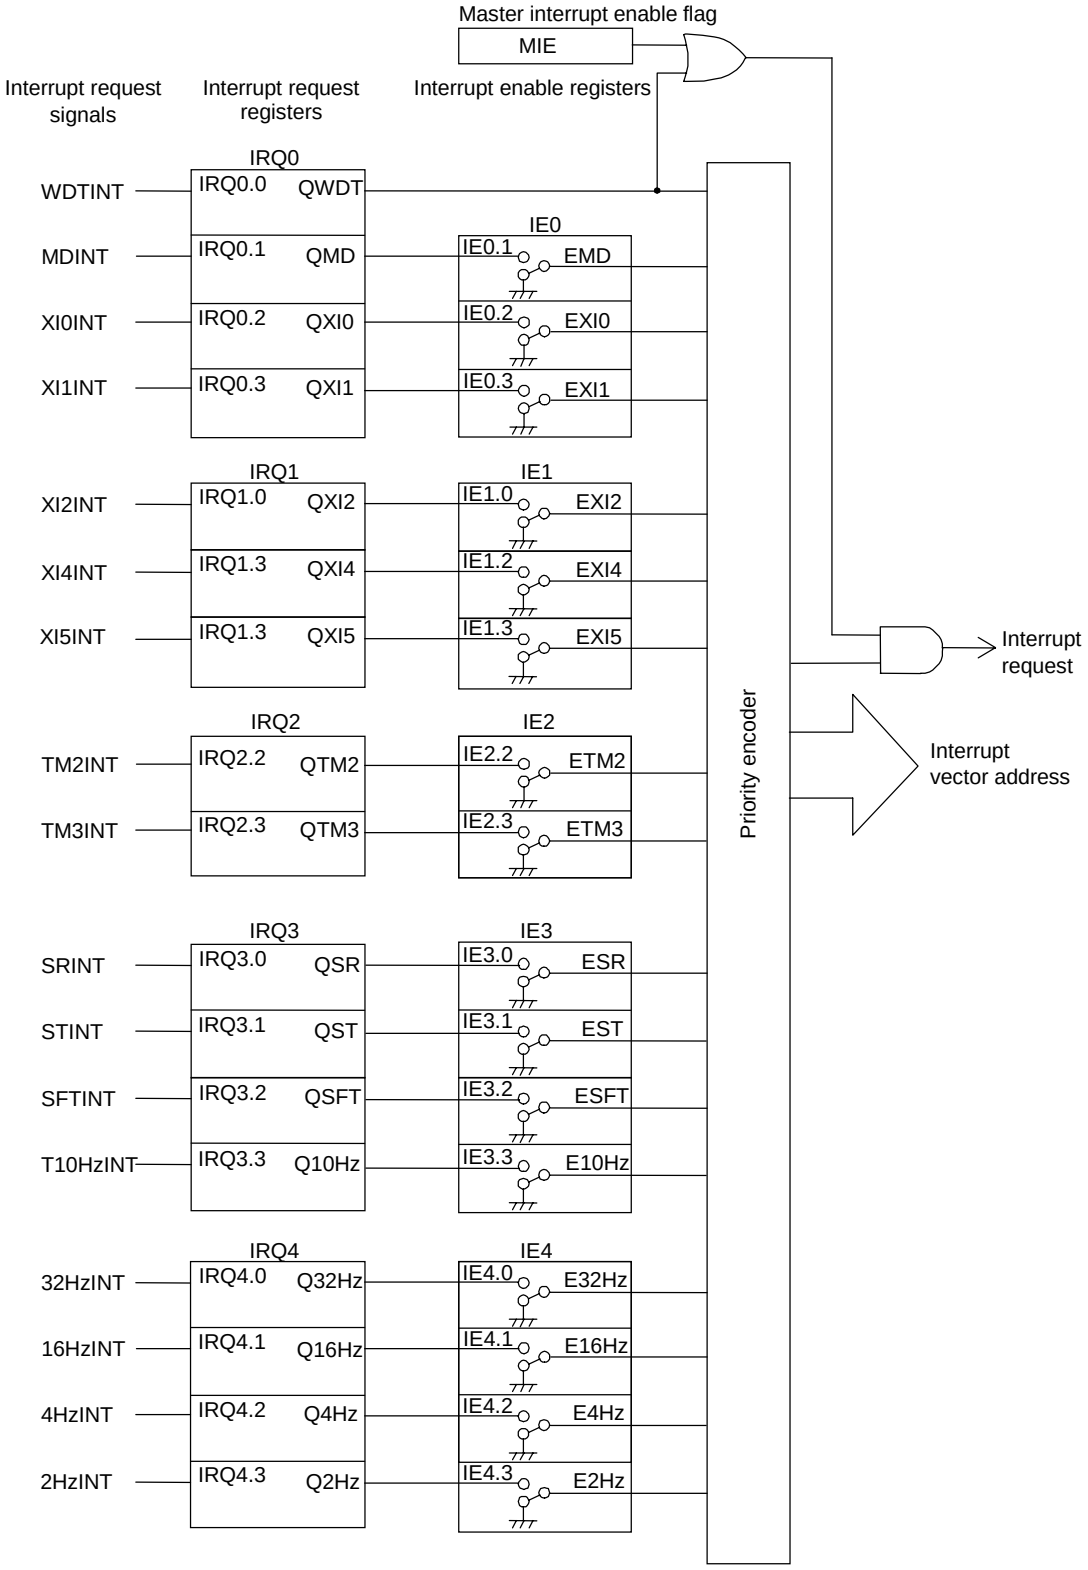

Figure 4-1 Interrupt Control Equivalent Circuit

4.2 Interrupt Registers

The following three types of registers are used to control interrupts.

(1) Master interrupt enable register (MIEF)
(2) Interrupt enable registers (IE0 to IE4)
(3) Interrupt request registers (IRQ0 to IRQ4)

These registers are described below.

(1) Master interrupt enable register (MIEF)

MIEF is a 4-bit register in which bit 0 is the master interrupt enable flag (MIE).

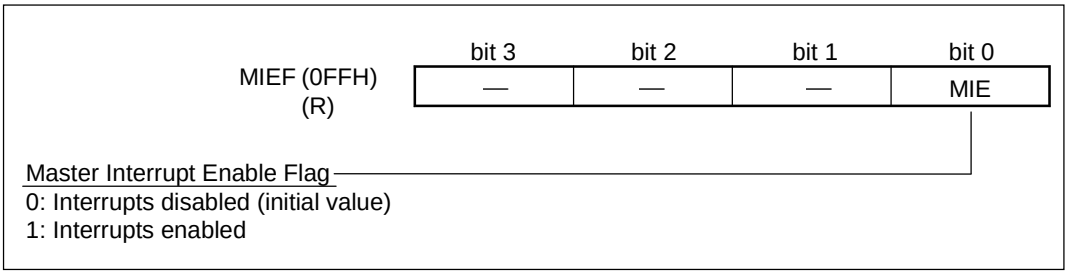
MIE (bit 0 of MIEF) is a flag that disables or enables all interrupts except for the watchdog timer interrupt.

If MIE is "0", all interrupts are disabled. If MIE is "1", all interrupts are enabled (with the exception of the watchdog timer).

When any interrupt is received, MIE is cleared to "0". MIE is set to "1" by execution of a return from interrupt instruction (RTI instruction).

If multi-level interrupt processing is to be performed, execute an RTI instruction (MIE←"1") during the interrupt processing routines.

At system reset, MIE is initialized to "0". MIEF only supports data reference (R) of data memory through addressing instructions.



Note:

When setting MIE, use "EI" instructions (MIE←"1") and "DI" instructions (MIE←"0").

(2) Interrupt enable registers (IE0 to IE4)

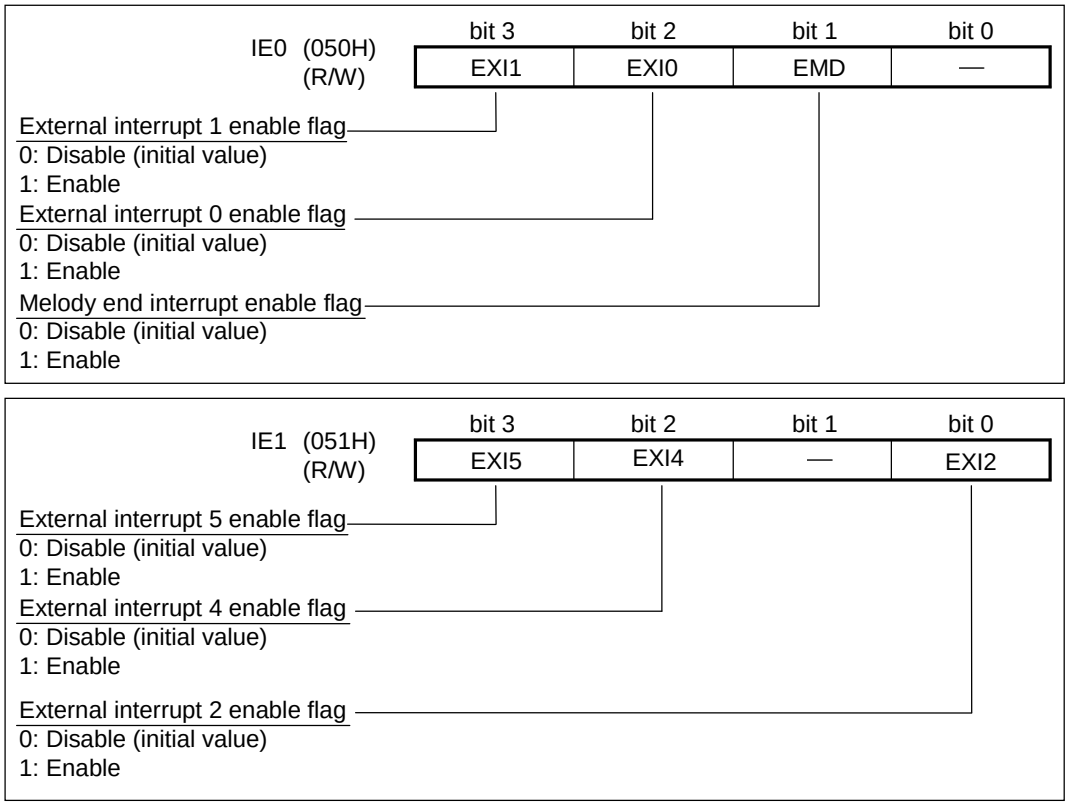
IE0, IE1, IE2, IE3, and IE4 are registers that consist of 4 bits each.

A logical AND of the corresponding bits of an interrupt enable register (IE0 to IE4) and an interrupt request register (IRQ0 to IRQ4) determines whether or not each interrupt request is issued to the CPU. The watchdog timer interrupt is non-maskable, and is therefore not dependent upon the interrupt enable registers (IE0 to IE4) and the master interrupt enable register (MIEF).

If multiple interrupts request the CPU at the same time, the interrupts are accepted in order of highest priority and low priority interrupts are placed on hold (see Table 4-1 for the order of priority).

When an interrupt is received, the master interrupt enable flag (MIE) is cleared to "0". The corresponding bits in the interrupt enable registers (IE0 to IE4) do not change.

At system reset, each bit of IE0 through IE4 is initialized to "0".



IE2 (052H) (R/W)

bit 3	bit 2	bit 1	bit 0
ETM3	ETM2	—	—

Timer 3 interrupt enable flag
0: Disable (initial value)
1: Enable

Timer 2 interrupt enable flag
0: Disable (initial value)
1: Enable

IE3 (053H) (R/W)

bit 3	bit 2	bit 1	bit 0
E10Hz	ESFT	EST	ESR

10 Hz interrupt enable flag
0: Disable (initial value)
1: Enable

Shift register interrupt enable flag
0: Disable (initial value)
1: Enable

Serial port transmit interrupt enable flag
0: Disable (initial value)
1: Enable

Serial port receive interrupt enable flag
0: Disable (initial value)
1: Enable

IE4 (054H) (R/W)

bit 3	bit 2	bit 1	bit 0
E2Hz	E4Hz	E16Hz	E32Hz

2 Hz interrupt enable flag
0: Disable (initial value)
1: Enable

4 Hz interrupt enable flag
0: Disable (initial value)
1: Enable

16 Hz interrupt enable flag
0: Disable (initial value)
1: Enable

32 Hz interrupt enable flag
0: Disable (initial value)
1: Enable

(3) Interrupt request registers (IRQ0 to IRQ4)

IRQ0, IRQ1, IRQ2, IRQ3 and IRQ4 are registers that consist of 4 bits each.

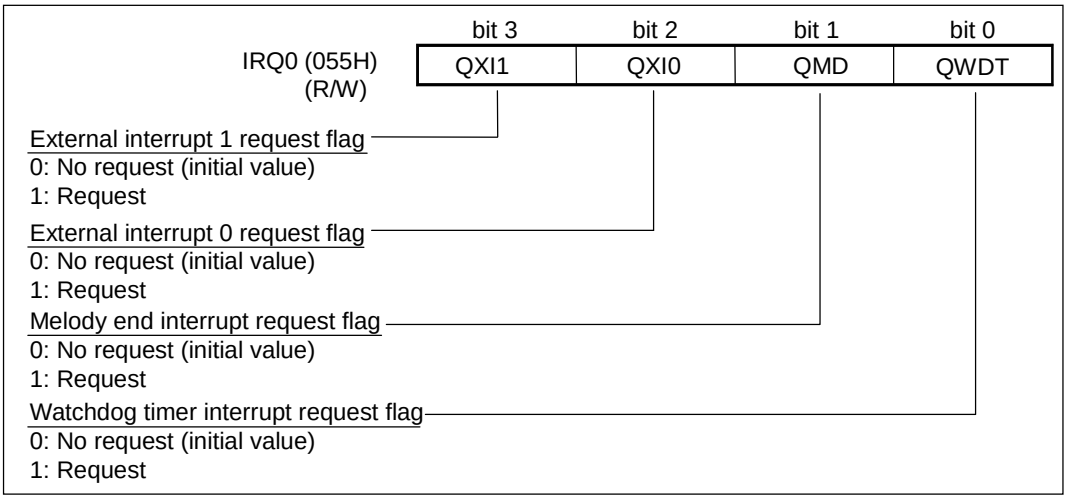
When an interrupt request is generated, the corresponding bit of the interrupt request register is set to "1" in the first half of the S1 state of the next instruction. So that the CPU can receive interrupt requests, set the master interrupt enable flag (MIE) to "1" and set the appropriate flag of the corresponding interrupt enable register (IE0 to IE4) to "1".

The watchdog timer interrupt is non-maskable and does not depend upon the interrupt enable register or the master interrupt enable register (MIEF).

Setting the appropriate bits of an interrupt request register to "1" allows software interrupts to be generated.

When an interrupt request is received, the corresponding bits of IRQ0 to IRQ4 are cleared to "0".

At system reset, each bit of IRQ0 through IRQ4 is initialized to "0".



bit 3: QXI1 (reQuest eXternal Interrupt 1)

The external interrupt 1 request flag.
The external interrupt 1 is assigned as the secondary function of each bit of port C (PC.0 to PC.3).
External interrupt 1 requests are generated by a 4-bit ORed input.

bit 2: QXI0 (reQuest eXternal Interrupt 0)

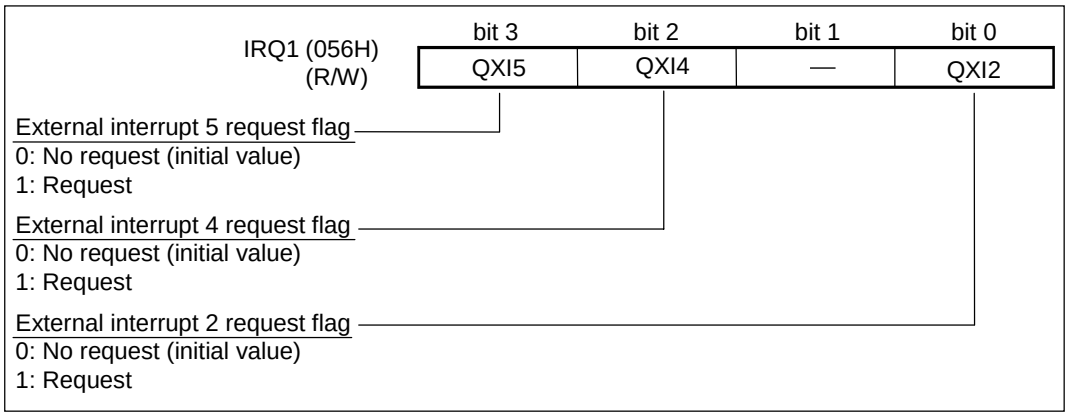
The external interrupt 0 request flag.
The external interrupt 0 is assigned as the secondary function of each bit of port B (PB.0 to PB.3).
External interrupt 0 requests are generated by a 4-bit ORed input.

bit 1: QMD (reQuest Melody Driver)

Melody end interrupt request flag.
Melody end interrupts are generated when the melody driver outputs the end note data (END bit = "1").

bit 0: QWDT (reQuest WatchDog Timer)

Watchdog timer interrupt request flag.
When the watchdog timer is started and then overflow occurs, an interrupt is requested. The watchdog timer interrupt is non-maskable and does not depend upon the interrupt enable registers or the master interrupt enable register (MIE).



bit 3: QXI5 (reQuest eXternal Interrupt 5)

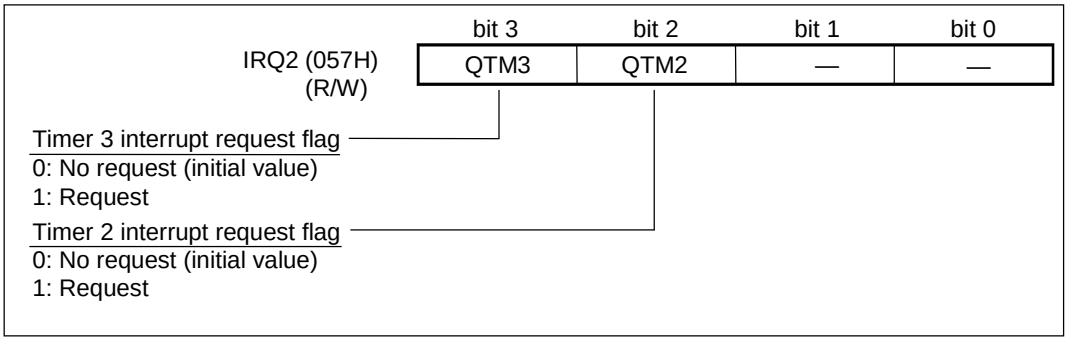
External interrupt 5 request flag.
The external interrupt 5 is assigned as a secondary function to each bit (P0.0 to P0.3) of port 0 and each bit (P1.0 to P1.3) of port 1.
An external interrupt request is generated through the 4-bit ORed input.

bit 2: QXI4 (reQuest eXternal Interrupt 4)

External interrupt 4 request flag.
The external interrupt 4 is assigned as a secondary function of port 8.3 (P8.3). Generation of the external interrupt 4 is triggered by the falling edge of the 128 Hz or 4 kHz output of the time base counter.

bit 0: QXI2 (reQuest eXternal Interrupt 2)

External interrupt 2 request flag.
The external interrupt 2 is assigned as a secondary function of port E.3 (PE.3). Generation of the external interrupt 2 is triggered by the falling edge of the 128 Hz or 4 kHz output of the time base counter.

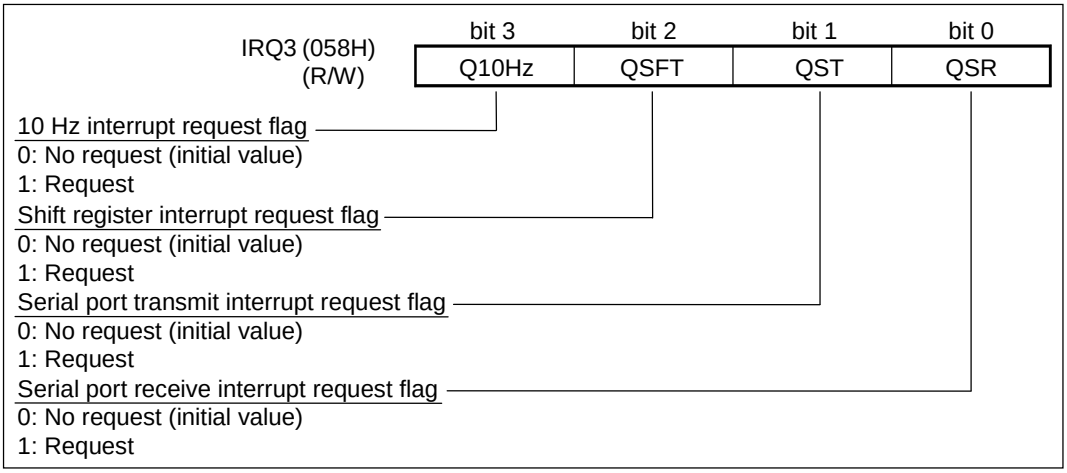


bit 3: QTM3 (reQuest TiMer 3)

Timer 3 interrupt request flag.
A timer 3 interrupt request is generated whenever timer 3 overflows.

bit 2: QTM2 (reQuest TiMer 2)

Timer 2 interrupt request flag.
A timer 2 interrupt request is generated whenever timer 2 overflows.



bit 3: Q10Hz (reQuest 10 Hz)

10 Hz interrupt request flag.
A 10 Hz interrupt request is generated whenever the 10 Hz carry generated by the 100 Hz timer counter is output.

bit 2: QSFT (reQuest ShiFT register)

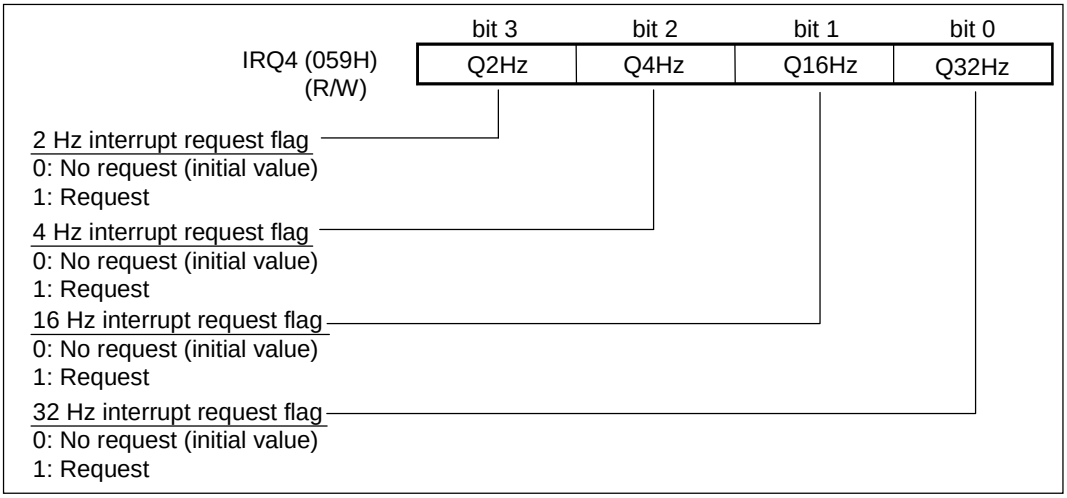
Shift register interrupt request flag.
A shift register interrupt is generated when the 8-bit data transfer for the shift register is completed.

bit 1: QST

Serial port transmit interrupt request flag.
A serial port transmit interrupt request is generated when a serial port transmit operation is completed.

bit 0: QSR

Serial port receive interrupt request flag.
A serial port receive interrupt is generated when a serial port receive operation is completed.



bit 3: Q2Hz (reQuest 2 Hz)

2 Hz interrupt request flag.
A 2 Hz interrupt request is generated at every falling edge of the 2 Hz output of the time base counter.

bit 2: Q4Hz (reQuest 4 Hz)

4 Hz interrupt request flag.
A 4 Hz interrupt request is generated at every falling edge of the 4 Hz output of the time base counter.

bit1: Q16Hz (reQuest 16 Hz)

16 Hz interrupt request flag.
A 16 Hz interrupt request is generated at every falling edge of the 16 Hz output of the time base counter.

bit 0: Q32Hz (reQuest 32 Hz)

32 Hz interrupt request flag.
A 32 Hz interrupt request is generated at every falling edge of the 32 Hz output of the time base counter.

4.3 Interrupt Sequence

4.3.1 Interrupt Processing

While MIE is "1", operation transfers to interrupt processing when individual interrupt factors are generated.

The watchdog timer interrupt is non-maskable and regardless of the MIE flag status, operation will shift to interrupt processing when the watchdog timer interrupt factor is generated.

The following processes are performed when an interrupt is generated.

(1) MIE and the corresponding interrupt request flag are cleared to "0".
(2) The program counter (PC) is saved on the call stack.
(3) The call stack pointer (SP) is incremented by 1. (SP←SP+1)
(4) The starting address of the interrupt routine is loaded into the program counter (PC).

Interrupt processing is performed in 0 machine cycles.

Figure 4-2 shows the stack contents after an interrupt is generated.

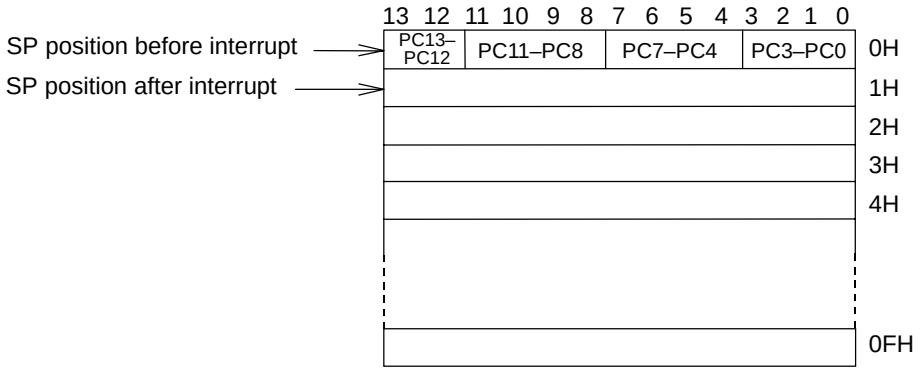


Figure 4-2 Call Stack Contents after Interrupt Generation

4.3.2 Return from an Interrupt Routine

Return from a watchdog timer interrupt routine is performed with an "RTNMI" instruction.

Return from all other interrupt routines is performed with an "RTI" instruction.

Execution of "RTI" and "RTNMI" instructions both require 1 machine cycle.

When returning from an interrupt routine, the CPU performs the following processes.

(1) The call stack pointer (SP) is decremented by 1. (SP←SP–1)
(2) MIE is set to "1" (when an "RTNMI" instruction is used, MIE is restored to its state prior to the interrupt).
(3) 1 is added to the call stack contents and that value is loaded into the program counter (PC).

 Note:

- While the MIE flag is "0" (interrupt disabled state), if a watchdog timer interrupt is processed and an "RTI" instruction is executed, the MIE flag will be set to "1" and interrupts enabled.
- Use "RTNMI" instructions to return from watchdog timer interrupts only. Use "RTI" instructions for normal interrupts.

4.3.3 Interrupt Hold Instructions

Interrupt requests are not received during execution of the following instructions. These instructions are processed with priority, and interrupt processing is delayed until completion of the instruction.

- ROM table reference instructions
- External memory transfer instructions
- Stack operation instructions
- Jump instructions
- Conditional branch instructions
- Call/return instructions
- "EI" (set MIE flag) instructions, "DI" (clear MIE flag) instructions and "MSA cadr15" (start melody output) instructions within control instructions

 Note:

If interrupt hold instructions are to be used consecutively, consider that an interrupt, when generated, will be put on hold for a certain amount of time before the interrupt routine begins.

Chapter 5

Clock Generator Circuit (OSC)

5. Clock Generator Circuit (OSC)

5.1 Overview

The clock generator circuit (OSC) consists of a low-speed clock generator circuit, a high-speed clock generator circuit and a clock controller unit. The clock generator circuit generates the system clock (CLK), time base clock (TBCCLK) and the high-speed clock (HSCLK).

The following modes can be selected for the low-speed clock generator circuit and the high-speed clock generator circuit.

- Low-speed clock generator circuit: crystal oscillation mode or RC oscillation mode (mask option selection)
- High-speed clock generator circuit: ceramic oscillation mode or RC oscillation mode (software selection)

The system clock is the basic operation clock for the CPU. The time base clock is the basic operation clock for the time base counter.

Depending on the contents of the frequency control register (FCON), the system clock frequency is switched to either the output of the low-speed clock generator circuit (TBCCLK) or the output of the high-speed clock generator circuit (HSCLK).

The frequency control register (FCON) also controls modes of the high-speed clock generator circuit.

5.2 Clock Generator Circuit Configuration

Figure 5-1 shows a block diagram of the clock generator circuit.

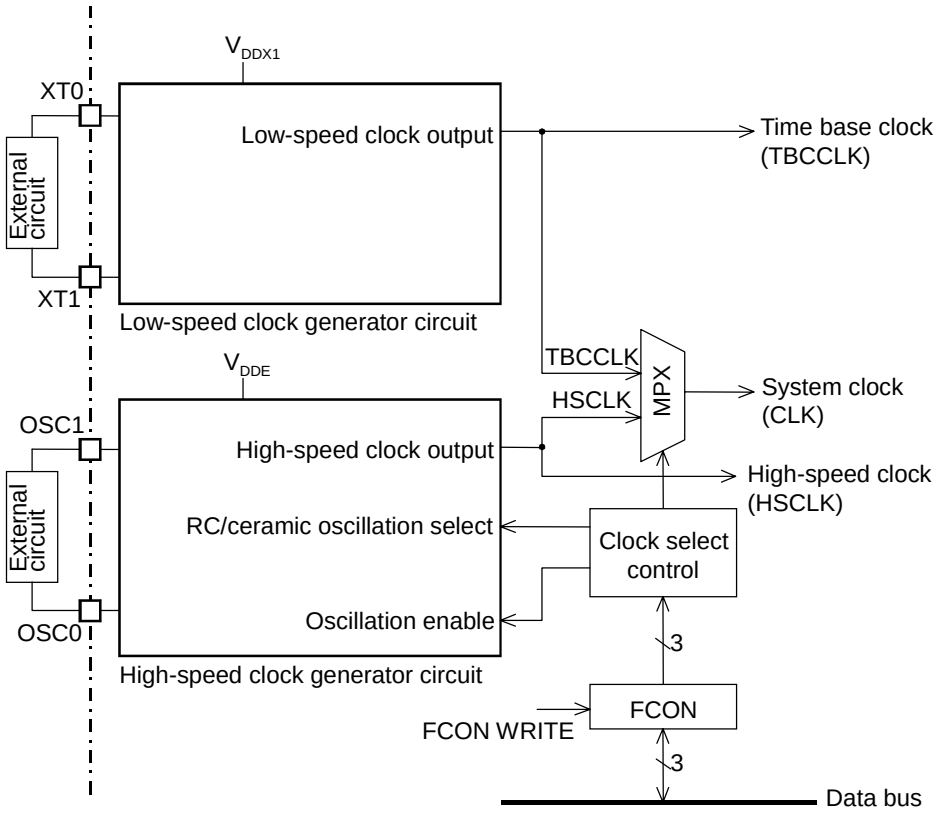

Figure 5-1 Clock Generator Circuit Configuration

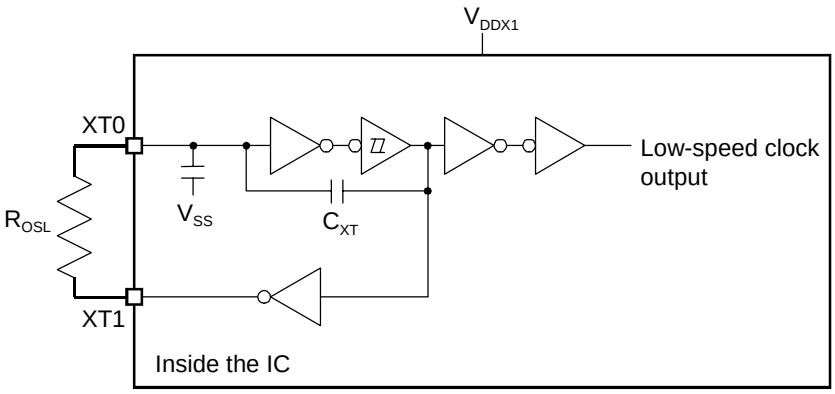
5.3 Low-Speed Clock Generator Circuit

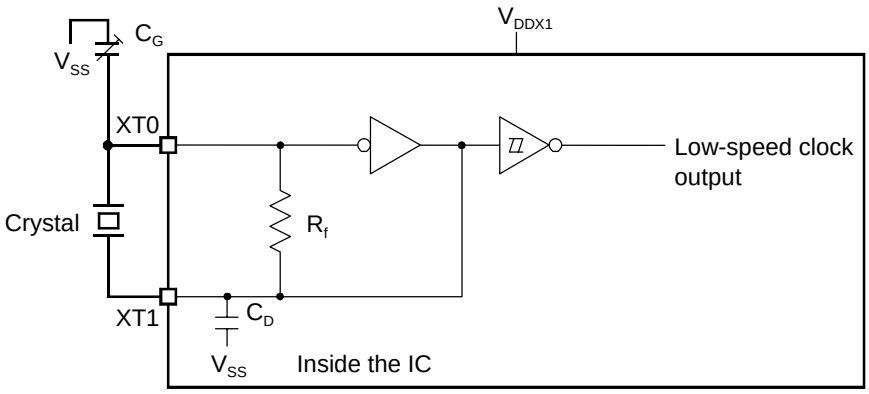
The low-speed clock generator circuit has two modes that are selected by the mask option, the RC oscillation mode and crystal oscillation mode. The oscillation frequency is 30 to 80 kHz.

For the RC oscillation mode, attach an external resistor, R_{OSL}, as shown in Figure 5-2(a).

For the crystal oscillation mode, attach an external crystal unit and capacitor, C_G, as shown in Figure 5-2(b).



(a) External Circuit for RC Oscillation Mode



(b) External Circuit for Crystal Oscillation Mode

Figure 5-2 External Circuits for Low-Speed Clock Oscillation

Note:

For convenience, the descriptions of this manual assume that a 32.768 kHz crystal unit is used in the low-speed clock oscillation circuit.

For the method of specifying mask options for the low-speed clock oscillation circuit, see "Appendix G: Mask Option."

Table 5-1 lists typical values of oscillation frequency when the low-speed side RC oscillation mode is selected. Table 5-2 shows an example external component to be attached when the low-speed side crystal oscillation mode is selected.

Table 5-1 Typical Oscillation Frequencies for the Low-Speed Side RC Oscillation Mode

R_{OSL}	f_{ROSL}
1.5 MΩ	32 kHz ±30%
700 kΩ	60 kHz ±30%
500 kΩ	80 kHz ±30%

Table 5-2 Example External Component for the Low-Speed Side Crystal Oscillation Mode

C_G	f_{XT}
12 pF	32.768 kHz

5.4 High-Speed Clock Generator Circuit

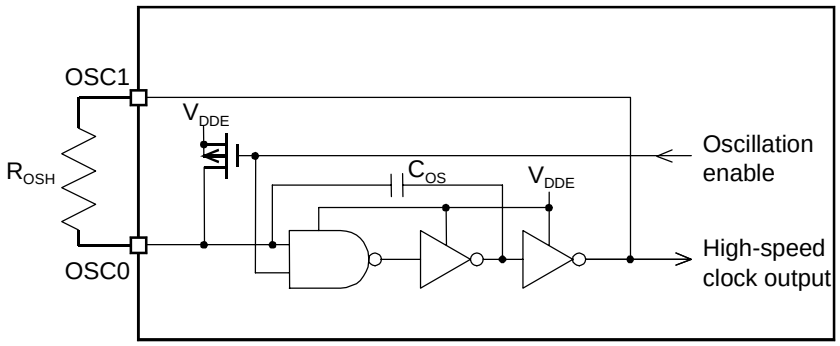
The high-speed clock generator circuit has two modes, the RC oscillation mode and ceramic oscillation mode. Oscillation modes are set by OSCSEL (bit 2 of FCON). The maximum oscillation frequency is 2 MHz.

- OSCSEL = "0" : RC oscillation mode
- OSCSEL = "1" : ceramic oscillation mode

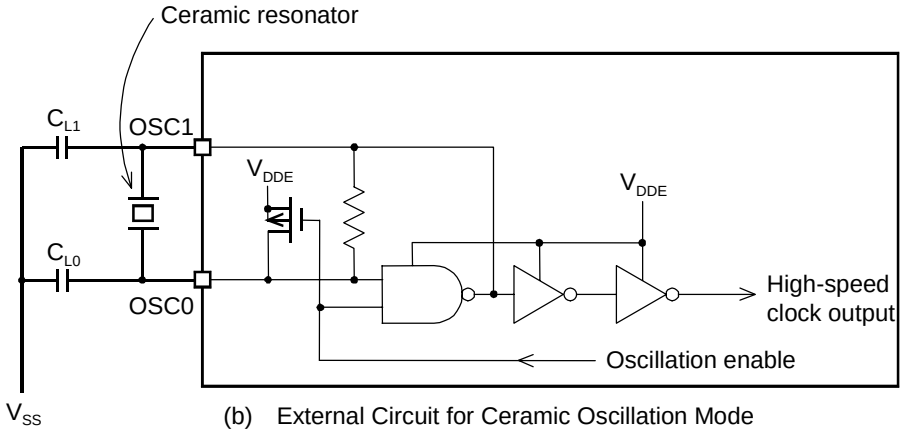
If the high-speed clock is not to be used, leave the OSC0 and OSC1 pins open (unconnected).

For the RC oscillation mode, attach an external resistor, R_{OSH}, as shown in Figure 5-3(a).

For the ceramic oscillation mode, attach an external ceramic unit and capacitors as shown in Figure 5-3(b).



(a) External Circuit for RC Oscillation Mode



(b) External Circuit for Ceramic Oscillation Mode

Figure 5-3 External Circuits for High-Speed Clock Oscillation

Table 5-3 lists typical values of oscillation frequency when the high-speed side RC oscillation mode is selected. Table 5-4 lists example external components to be attached when the high-speed side ceramic oscillation mode is selected.

Table 5-3 Typical Oscillation Frequencies for the High-Speed Side RC Oscillation Mode

R_{OSH} (kΩ)	V_{DD} (V)	f_{ROSH}
100	3.5 to 7.2	700 kHz ±30%
75		1 MHz ±30%
51		1.35 MHz ±30%
30		2 MHz ±30%

Table 5-4 Example External Components for the High-Speed Side Ceramic Oscillation Mode

C_{L0} (pF)	C_{L1} (pF)	Ceramic unit
330	330	CSB200D (200 kHz)*
220	220	CSB300D (300 kHz)*
150	150	CSB500E (500 kHz)*
68	68	CSB1000J (1 MHz)*
30	30	CSA2.00MG (2 MHz)*

* Ceramic unit manufactured by Murata MFG. Co., Ltd.

5.5 System Clock Control

The system clock is the basic operation clock of the CPU.

The clock can be selected as follows with the CPUCLK (bit 0 of FCON) setting.

- CPUCLK = "0" (initial value)
  The output of the low-speed clock generator circuit (TBCCLK) is the system clock.
- CPUCLK = "1"
  The output of the high-speed clock generator circuit (HSCLK) is the system clock.

When HSCLK is selected as the system clock, the high-speed clock must be in the oscillating state (ENOSC = "1"). The crystal generator circuit will continue to oscillate even when the high-speed generator circuit is selected.

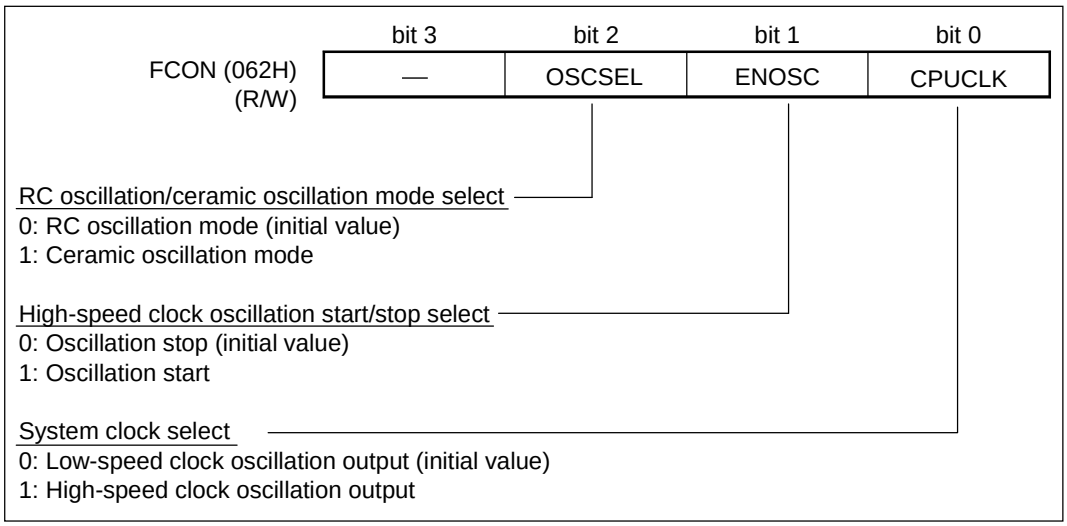
To reduce the total power consumption in applications that use the high-speed clock generator circuit, the following clock controls are generally implemented in software.

- During normal operation, the output of the low-speed clock generator circuit (CPUCLK = "0") should be the system clock.
- Only when high-speed operation is necessary should the high-speed clock oscillate (ENOSC = "1") and output of the high-speed clock generator circuit (CPUCLK = "1") should be selected.

For details of the system clock select timing, refer to section 5.7, "System Clock Select Timing".

5.6 Frequency Control Register (FCON)

FCON is a special function register (SFR) that selects the system clock.



bit 2: OSCSEL

This bit selects the RC oscillation mode or the ceramic oscillation mode of the high-speed clock generator circuit. At system reset, this bit is cleared to "0", selecting the RC oscillation mode.

bit 1: ENOSC

This bit starts and stops oscillation of the high-speed clock generator circuit. At system reset, this bit is cleared to "0", stopping oscillation of the high-speed clock generator circuit.

bit 0: CPUCLK

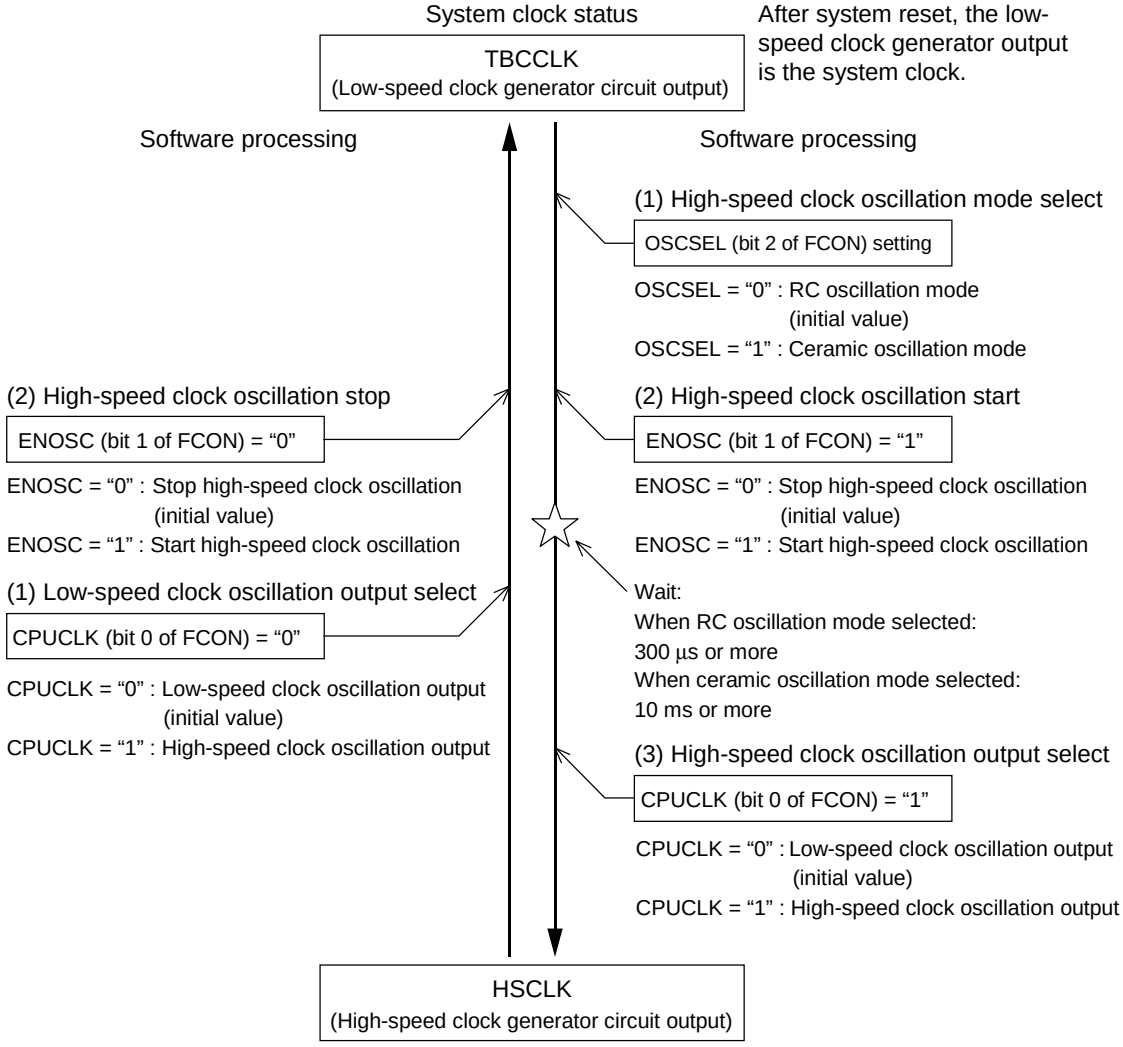
This bit selects the system clock, the basic operation clock of the CPU. At system reset, this bit is cleared to "0", selecting output of the low-speed clock generator circuit (TBCCLK).

5.7 System Clock Select Timing

After system reset, the system clock is TBCCLK.

When high-speed operation is necessary, switch the system clock to HSCLK.

A flowchart of system clock operation is shown below.



When ENOSC (bit 1 of FCON) is set to "1", oscillation starts in the mode selected by OSCSEL. At the same time, the internal logic power supply (V_{DDL}) switches from the constant voltage circuit output level (approx. 1.5 V) to the V_{DDE} level. Next, if CPUCLK is set to "1", the system clock switches from crystal oscillation output (TBCCLK) to high-speed clock output (HSCLK).

Figure 5-4 shows the system clock select timing and status of the internal logic power supply (V_{DDL}).

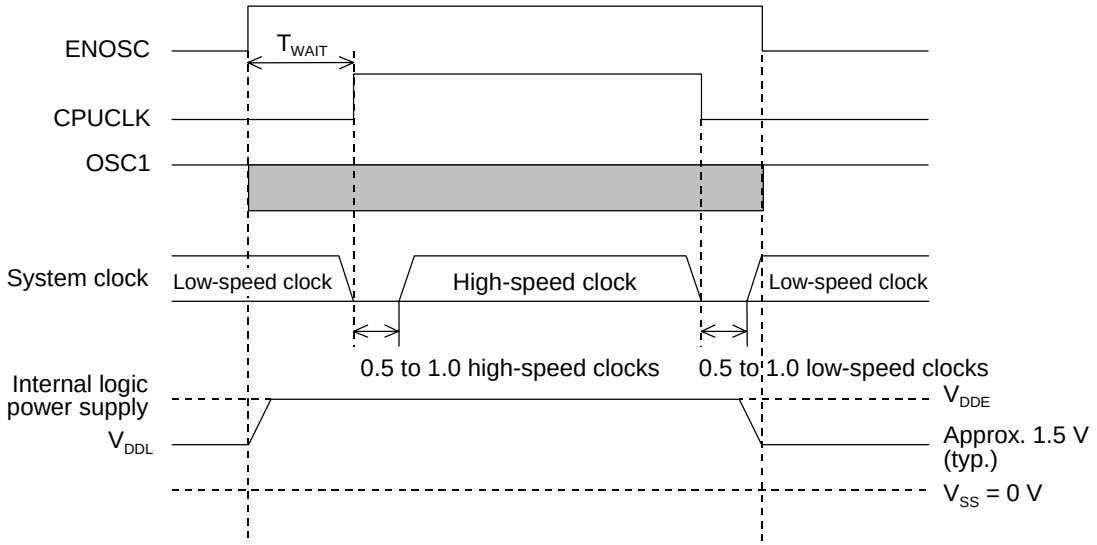


Figure 5-4 System Clock Select Timing

In the ceramic oscillation mode, 10 ms are required from the time when ENOSC is set to "1" until the high-speed clock generator circuit enters the oscillating state. Therefore, in this mode, when switching CPUCLK to a high-speed setting, wait for an interval of at least T_{WAIT} = 10 ms after the rising edge of ENOSC.

In the RC oscillation mode, oscillation begins soon after setting ENOSC to "1". When switching CPUCLK to a high-speed setting, wait for an interval of at least T_{WAIT} = 300 µs after the rising edge of ENOSC.

When switching from the high-speed mode to the low-speed mode, set the CPUCLK bit to "0", and sometime after the next instruction, set the ENOSC bit to "0".

Chapter 6

Time Base Counter (TBC)

6. Time Base Counter (TBC)

6.1 Overview

The time base counter (TBC) is a 15-bit internal counter, which generates the clock supplied to internal peripheral functions.

The TBC clock is a time base clock (TBCCLK).

TBC outputs are used for functions such as time base interrupts and various other circuits.
TBC8–11 and TBC12–15 can be read/reset by software.

The TBC generates an interrupt request at the falling edge of 32 Hz/16 Hz/4 Hz/2 Hz output.

The TBC is initialized to 0000H at system reset.

6.2 Time Base Counter Configuration

The configuration of the time base counter (TBC) is shown in Figure 6-1.

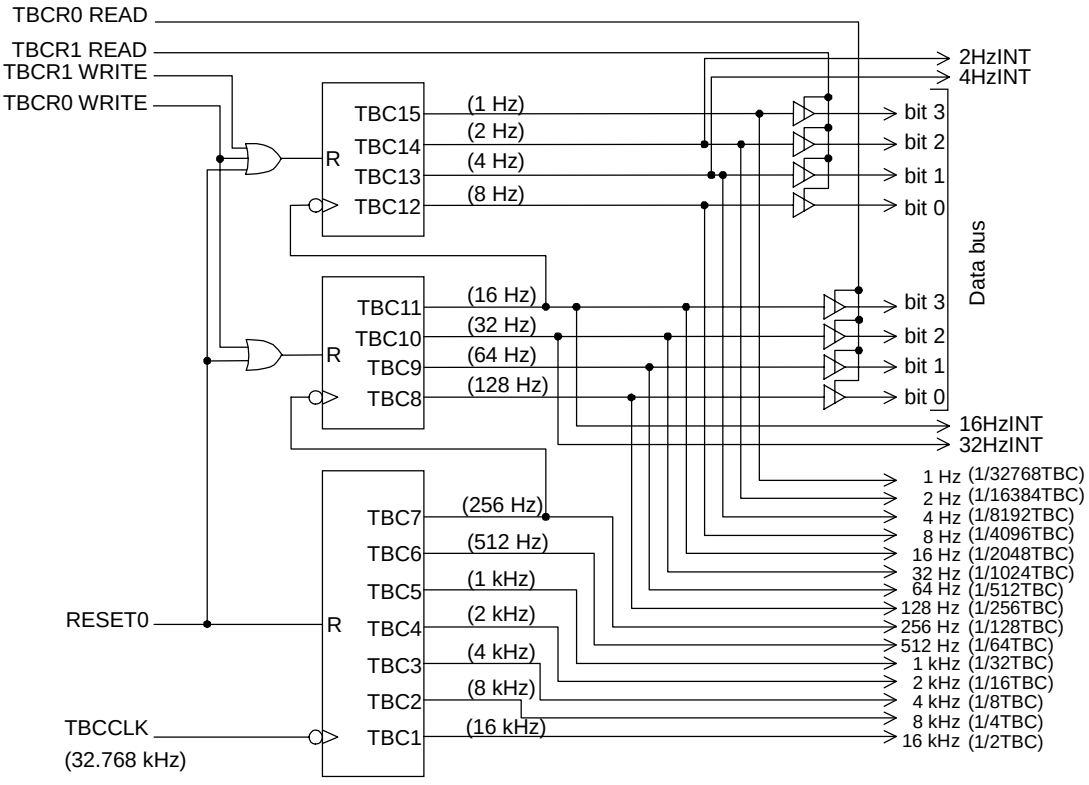

Figure 6-1 Time Base Counter (TBC) Configuration

(when a 32.768 kHz crystal is used for low-speed clock oscillation)

6.3 Time Base Counter Registers

Time base counter register 0 (TBCR0), time base counter register 1 (TBCR1)

These 4-bit special function registers (SFRs) are used to read the 1 to 8 Hz and 16 to 128 Hz outputs of the time base counter.

A write operation to TBCR0 sets both the 1 to 8 Hz and 16 to 128 Hz outputs to "0", and a write operation to TBCR1 sets the 1 to 8 Hz outputs to "0".

	bit 3	bit 2	bit 1	bit 0
TBCR0 (060H) (R/W)	16 Hz	32 Hz	64 Hz	128 Hz
	bit 3	bit 2	bit 1	bit 0
TBCR1 (061H) (R/W)	1 Hz	2 Hz	4 Hz	8 Hz

6.4 Time Base Counter Operation

After system reset the time base counter (TBC) begins to count up from 0000H. The count is incremented at the falling edge of the TBCCLK.

TBC 32 Hz/16 Hz/4 Hz/2 Hz outputs are used as time base interrupts. At their respective output falling edges, the four bits of interrupt request register 4 (IRQ4) are set to "1", namely bit 3 (Q32Hz), bit 2 (Q16Hz), bit 1 (Q4Hz) and bit 0 (Q2Hz), requesting an interrupt to the CPU. TBC outputs are also used as clocks for various circuits.

TBC 1 to 8 Hz outputs and 16 to 128 Hz outputs can be read through the time base counter registers 0/1 (TBCR0/TBCR1).

A write operation to TBCR1 sets the 1 to 8 Hz output counter to "0", and a write operation to TBCR0 sets both the 1 to 8 Hz and 16 to 128 Hz output counters to "0". The write data in these write operations has no significance. For example, the "MOV TBCR0, A" instruction can be used to write, but is not dependent on accumulator content in any way. When write is executed to TBCR0 and TBCR1 and the 1 to 8 Hz and 16 to 128 Hz counters reset, interrupt requests are generated if 32 Hz/16 Hz/4 Hz/2 Hz outputs have been set to "1". To disable these interrupts, first set the master interrupt enable flag (MIE) or interrupt enable register 4 (IE4) to "0", execute the write operation to TBCR0/1, and set the interrupt request flag 4 (IRQ4) to "0".

Figure 6-2 shows interrupt generation timing and time base counter output reset timing by writing "1" to TBCR0 and TBCR1.

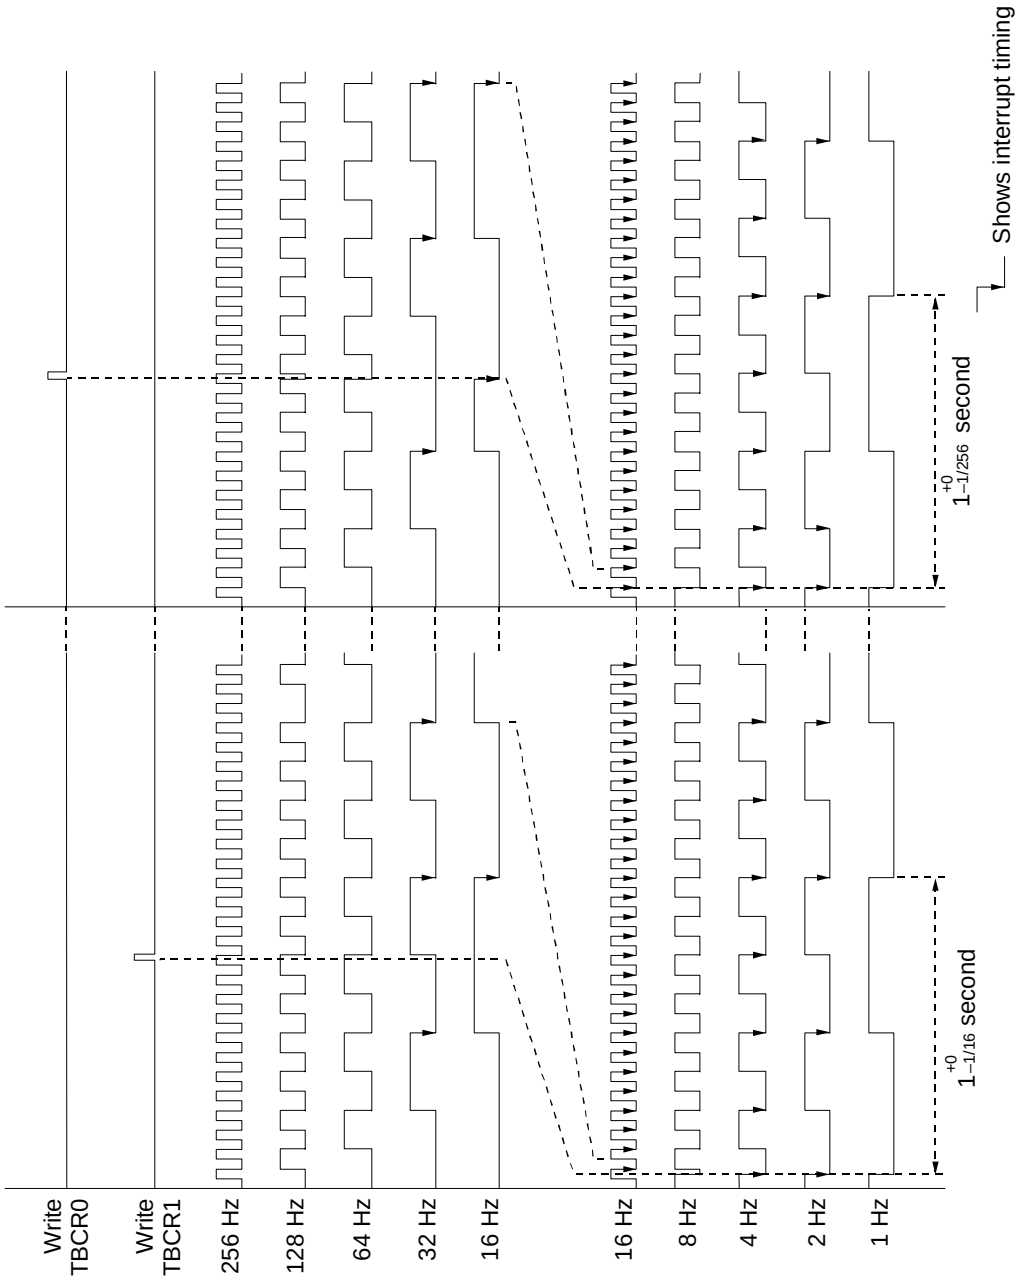

Figure 6-2 Interrupt Timing and Reset Timing by Writing "1" to TBCR0, TBCR1

Chapter 7

Timers (TIMER)

7. Timers (TIMER)

7.1 Overview

The ML63295A has two internal 8-bit timers (timers 2 and 3). Timers 2 and 3 can be used in tandem as a 16-bit timer.

Timers 2 and 3 have two modes: auto-reload and frequency measurement. Timer clock may be set to the time base clock (TBCCLK: 32.768 kHz), the high-speed clock (HSCLK), or an external clock. When using the timers as a 16-bit timer, the overflow signals of timer 2 is used as the clocks for timer 3.

Timers can be used not only for pulse generation and time measurement, but as baud rate generators for serial communication.

	Timer 2	Timer 3
8-bit timer	●	●
16-bit timer	● (Timer 2 overflow signal is used as clock for timer 3)	
Clock	TBCCLK/HSCLK/External clock (T2CK, T3CK)	
Auto-reload mode	●	●
Frequency measurement mode	●	●

7.2 Timer Configuration

Figures 7-1 and 7-2 show the configuration of timers 2 and 3 respectively.

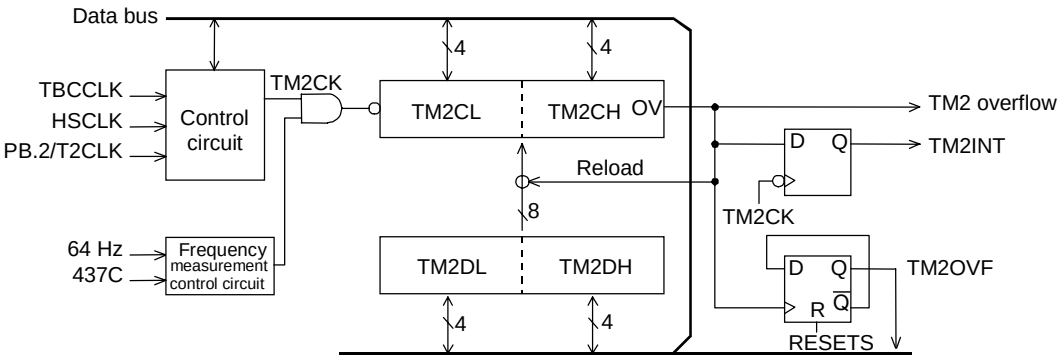

Figure 7-1 Timer 2 Configuration

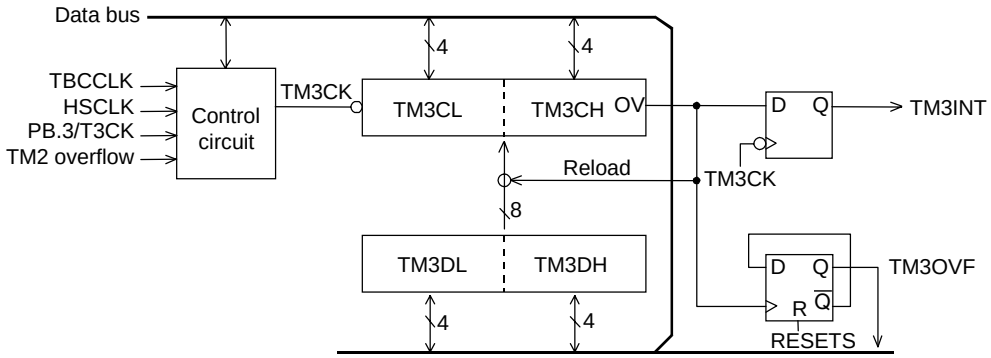

Figure 7-2 Timer 3 Configuration

7.3 Timer Registers

The following four types of registers are used for timer control:

(1) Timer data registers
(TM2DL, TM2DH, TM3DL, TM3DH)
(2) Timer counter registers
(TM2CL, TM2CH, TM3CL, TM3CH)
(3) Timer control registers
(TM2CON0, TM2CON1, TM3CON0, TM3CON1)
(4) Timer status registers
(TM2STAT, TM3STAT)

These registers are described below for each type.

(1) Timer data registers
(TM2DL, TM2DH, TM3DL, TM3DH)

- During the auto-reload mode, timer data registers store the reload values.
- At system reset, all valid bits are cleared to "0".
- Note regarding register values:
  When a value is written to any timer counter register, the same value is also written to the corresponding timer data register. However, when writing to a timer data register, the same value is not written to the corresponding timer counter register.

Timer 2 Registers

		bit 3	bit 2	bit 1	bit 0
TM2DL (Timer 2 lower)	(076H) (R/W)	T2D3	T2D2	T2D1	T2D0

		bit 3	bit 2	bit 1	bit 0
TM2DH (Timer 2 upper)	(077H) (R/W)	T2D7	T2D6	T2D5	T2D4

Timer 3 Registers

		bit 3	bit 2	bit 1	bit 0
TM3DL (Timer 3 lower)	(078H) (R/W)	T3D3	T3D2	T3D1	T3D0

		bit 3	bit 2	bit 1	bit 0
TM3DH (Timer 3 upper)	(079H) (R/W)	T3D7	T3D6	T3D5	T3D4

(2) Timer counter registers
(TM2CL, TM2CH, TM3CL, TM3CH)

- 8-bit binary counter operation
- At system reset, all valid bits are cleared to "0".
- Note regarding register values:
  When a value is written to any timer counter register, the same value is also written to the corresponding timer data register. However, when writing to a timer data register, the same value is not written to the corresponding timer counter register.

Timer 2 Registers

		bit 3	bit 2	bit 1	bit 0
TM2CL (Timer 2 lower)	(07AH) (R/W)	T2C3	T2C2	T2C1	T2C0
TM2CH (Timer 2 upper)	(07BH) (R/W)	T2C7	T2C6	T2C5	T2C4

Timer 3 Registers

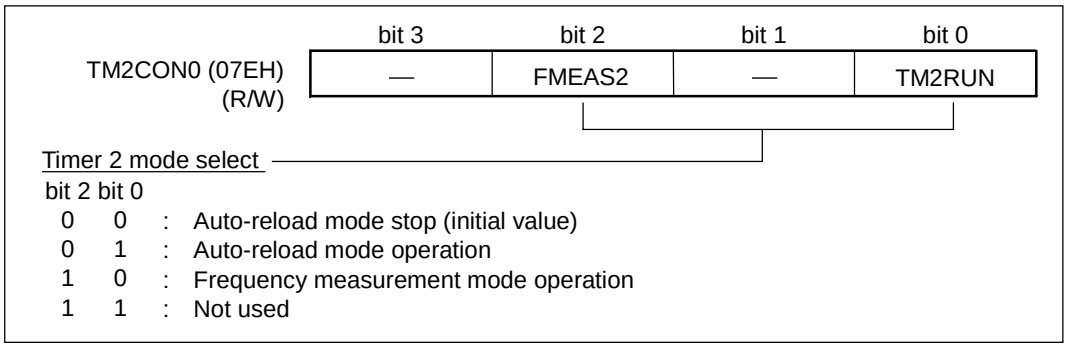
		bit 3	bit 2	bit 1	bit 0
TM3CL (Timer 3 lower)	(07CH) (R/W)	T3C3	T3C2	T3C1	T3C0
TM3CH (Timer 3 upper)	(07DH) (R/W)	T3C7	T3C6	T3C5	T3C4

(3) Timer control registers
(TM2CON0, TM2CON1, TM3CON0, TM3CON1)

- Timer control registers select the operation mode and clock for each timer.
- At system reset, all valid bits are cleared to "0".
- Note regarding register values:
  When a value is written to any timer counter register, the same value is also written to the corresponding timer data register. However, when writing to a timer data register, the same value is not written to the corresponding timer counter register.

Timer 2 Registers

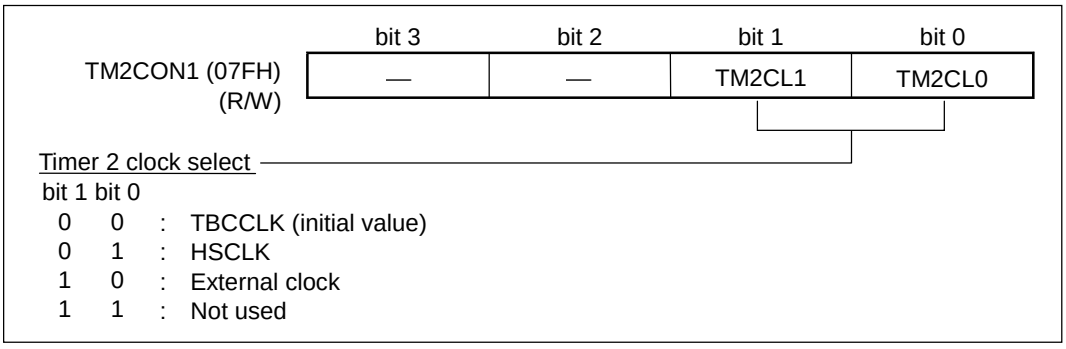
To use timer 3 in combination as a 16-bit timer, set timer 3 control registers TM3CON0 and TM3CON1.



bit 2, 0: FMEAS2, TM2RUN

These bits select the timer 2 operation mode.

The timer 2 operation mode can be selected as auto-reload mode or frequency measurement mode.



bit 1, 0: TM2CL1, TM2CL0

These bits select the timer 2 clock.

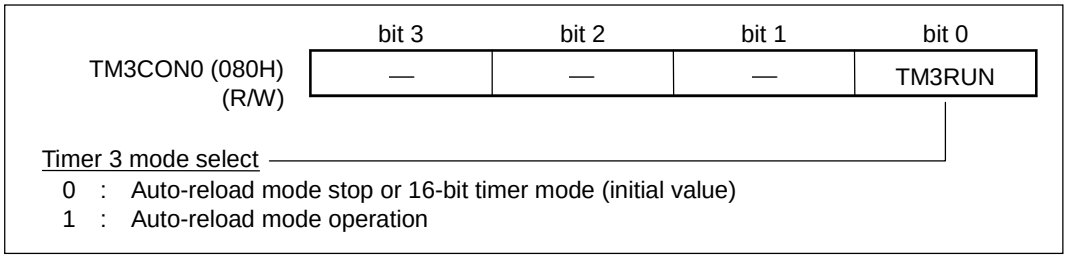
The timer 2 clock can be selected as TBCCLK (low-speed clock), HSCLK (high-speed clock), or external clock (T2CK: secondary function of PB.2).

Note:

If HSCLK is used as the clock, after ENOSC (bit 1 of FCON) is set to "1", wait for the following time interval before starting timer operation.

- Wait at least 10 ms when using ceramic oscillation.
- Wait at least 300 μs when using RC oscillation.

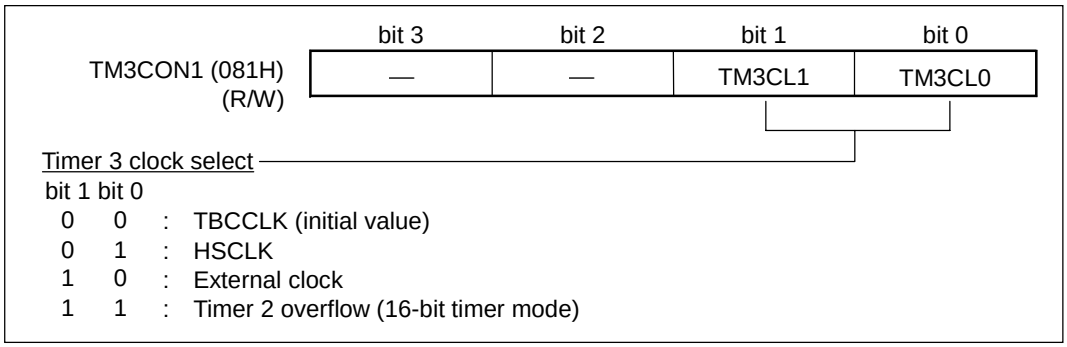
Timer 3 Registers



bit 0: TM3RUN

This bit selects the timer 3 operation mode.

The timer 3 operation mode can be selected as auto-reload mode or 16-bit timer mode.



bit 1, 0: TM3CL1, TM3CL0

These bits select the timer 3 clock.

The timer 3 clock can be selected as TBCCLK (low-speed clock), HSCLK (high-speed clock), external clock (T3CK: secondary function of PB.3), or the timer 2 overflow flag.

When using as a 16-bit timer, select timer 2 overflow for the clock.

Note:

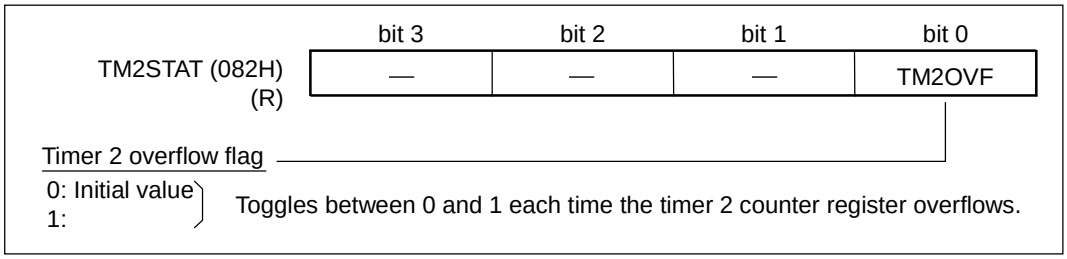
If HSCLK is used as the clock, after ENOSC (bit 1 of FCON) is set to "1", wait for the following time interval before starting timer operation.

- Wait at least 10 ms when using ceramic oscillation.
- Wait at least 300 μs when using RC oscillation.

(4) Timer status registers (TM2STAT, TM3STAT)

- Timer status registers read the status of each timer.
- At system reset, all valid bits are cleared to "0".

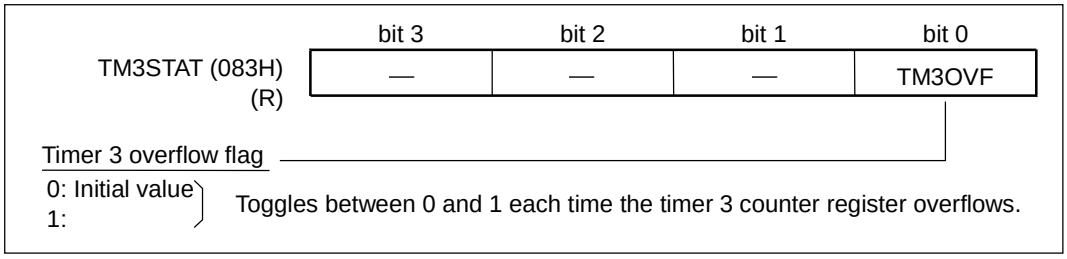
Timer 2 Register



bit 0: TM2OVF (TiMer 2 OVerFlow)

This bit indicates that the timer counter register has overflowed.
This bit toggles between "0" and "1" whenever overflow occurs.
At system reset, TM2OVF is cleared to "0".

Timer 3 Register



bit 0: TM3OVF (TiMer 3 OVerFlow)

This bit indicates that the timer counter register has overflowed.
This bit toggles between "0" and "1" whenever overflow occurs.
At system reset, TM3OVF is cleared to "0".

[Supplement] List of Timer Registers

Timer 2 Registers

Name	Symbol	Address	R/W	Initial value
Timer 2 data register L	TM2DL	076H	R/W	0H
Timer 2 data register H	TM2DH	077H		0H
Timer 2 counter register L	TM2CL	07AH	R/W	0H
Timer 2 counter register H	TM2CH	07BH		0H
Timer 2 control register 0	TM2CON0	07EH	R/W	0AH
Timer 2 control register 1	TM2CON1	07FH		0CH
Timer 2 status register	TM2STAT	082H	R	0EH

Timer 3 Registers

Name	Symbol	Address	R/W	Initial value
Timer 3 data register L	TM3DL	078H	R/W	0H
Timer 3 data register H	TM3DH	079H		0H
Timer 3 counter register L	TM3CL	07CH	R/W	0H
Timer 3 counter register H	TM3CH	07DH		0H
Timer 3 control register 0	TM3CON0	080H	R/W	0EH
Timer 3 control register 1	TM3CON1	081H		0CH
Timer 3 status register	TM3STAT	083H	R	0EH

7.4 Timer Operation

7.4.1 Timer Clock

The timer clock can be selected as TBCCLK (low-speed clock: 32.768 kHz), HSCLK (high-speed clock), or an external clock. By using timer 2 overflow signals as clocks for timer 3, the timers can be used in pairs as 16-bit timers.

If the high-speed clock (HSCLK) is to be used, after setting ENOSC (bit 1 of FCON), wait at least 10 ms in the ceramic oscillation mode or 300 μs in the RC oscillation mode before operating the timer.

The external clock is input to a port assigned as a secondary function port. In the case of timer 2, PB.2/T2CK is used as the input pin for the external clock. In the case of timer 3, PB.3/T3CK is used as the input pin for the external clock. Since the external clock is sampled by the system clock (CLK), the high and low levels of the external clock should be longer than 1 cycle of the system clock (CLK).

7.4.2 Timer Data Registers

TM2DL, TM2DH, TM3DL and TM3DH are 4-bit registers.

In the auto-reload mode, the timer data registers save values that are reloaded into the timer counter registers when the timer counter registers overflow.

Each timer data register can be read/written by software. Writing to timer data registers does not change the contents of the timer counter registers.

7.4.3 Timer Counter Registers

TM2CL and TM2CH, and TM3CL and TM3CH are 8-bit binary counters that are incremented at the falling edge of the timer clock.

Each timer counter register can be read/written by software. However, if the CPU clock and timer clock are different, values that are read or written during the count operation cannot be guaranteed. If an external clock is used as the timer clock, reading/writing is always possible.

When a value is written to any timer counter register, the same value is also written to the corresponding timer data register.

7.4.4 Timer Interrupt Requests and Overflow Flags

Timers generate timer interrupt requests when the timer counter register overflows. The overflow flag toggles between "1" and "0" at each overflow.

Figure 7-3 indicates the operation timing for timer counter register overflow. Table 7-1 lists timer interrupts.

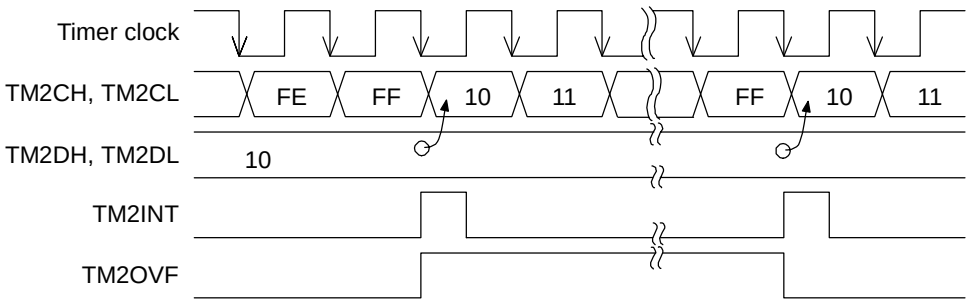


Figure 7-3 Timer Counter Register Overflow Timing (for Timer 2)

Table 7-1 List of Timer Interrupts

Interrupt factor	Symbol	IRQ flag (IRQ2)	IE flag (IE2)	Interrupt vector address
Timer 2 interrupt	TM2INT	QTM2	ETM2	0024H
Timer 3 interrupt	TM3INT	QTM3	ETM3	0026H

When the master interrupt enable flag (MIE) is set to "1" with the interrupt enable flags (ETM2, 3) set to "1", and a timer overflow occurs, a CPU interrupt request is generated.

7.4.5 Auto-Reload Mode Operation

Timers 2 and 3 can be used as auto-reload mode timers. The setup method is as follows.

- Timer 2: Set FMEAS2 (bit 2 of TM2CON0) to "0".
- Timer 3: No setup needed.

In the auto-reload mode, each time the timer counter register overflows, the timer data register value is reloaded into the timer counter register, and counting begins from the value. Setting the RUN bits (TM2RUN, TM3RUN) for each timer control register to "1" will restart the count, and resetting to "0" stops the count.

In the 16-bit timer mode for timers 2 and 3 the TM3RUN bit is disabled, and start/stop is controlled with the TM2RUN bit.

Figure 7-4 shows auto-reload mode timing for pulse generation when timers 2 and 3 are used as a 16-bit timer.

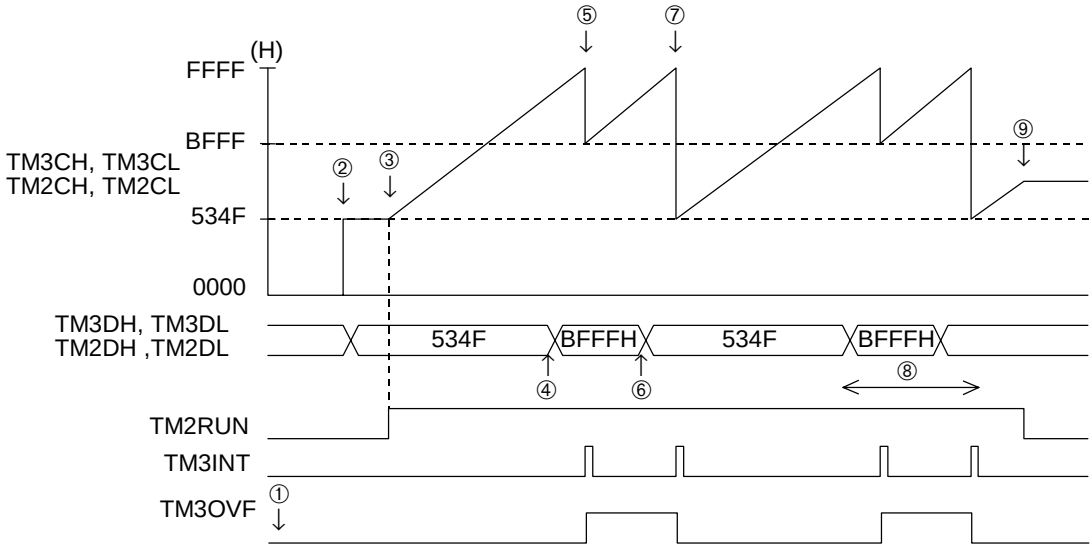

Figure 7-4 Auto-Reload Mode Timing

The operation procedures are as follows.

① Write 534FH to the timer data and timer counter registers.
TM3DH = TM3CH = 5H (bits 15–12)
TM3DL = TM3CL = 3H (bits 11–8)
TM2DH = TM2CH = 4H (bits 7–4)
TM2DL = TM2CL = FH (bits 3–0)

② If TM2CON and TM3CON are set to auto-reload mode and TM2RUN is set to "1", the timer counter register will start to count from 534FH.

③ Before the timer counter register overflows, write the next reload value BFFFH to the timer data register.

④ When the timer counter register overflows, BFFFH is set to the timer counter register, timer interrupt TM3INT is generated and timer 3 overflow flag TM3OVF toggles. The timer counter register continues to count up from BFFFH.

⑤ Before the timer counter register overflows, write the next reload value 534FH to the timer data register.

⑥ When the timer counter register overflows, 534FH is set to the timer counter register, timer interrupt TM3INT is generated and timer 3 overflow flag TM3OVF toggles. The timer counter register resumes counting from address 534FH.

⑦ Repeat steps 3 through 6.

⑧ Halt the count by resetting TM2RUN to "0".

Figure 7-5 shows TM2RUN count start/halt timing.

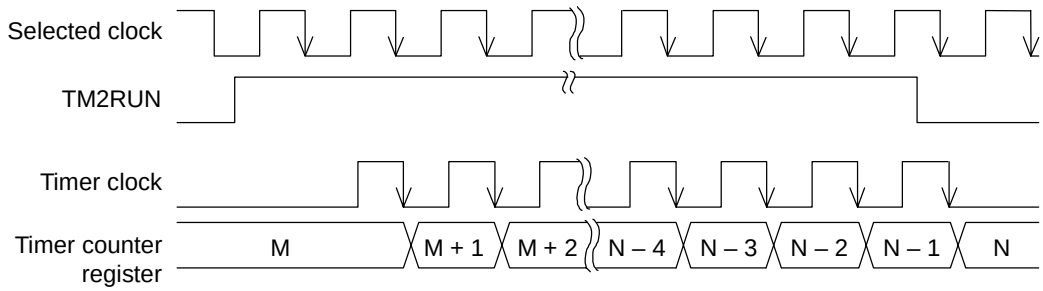

Figure 7-5 TM2RUN Count Start/Halt Timing

When TM2RUN is set to "1", the timer counter starts to count from the second falling edge of the selected clock. When TM2RUN is reset to "0", the counter stops counting at the falling edge of the selected clock which appears immediately after the TM2RUN falling edge.

7.4.6 Frequency Measurement Mode Operation

The frequency measurement mode is used to measure the frequency of the RC oscillator clock, which has wide product variation.

Timers 2 and 3 can be used in the frequency measurement mode. These timers are set as follows for the frequency measurement mode:

- Timer 2: Set FMEAS2 (bit 2 of TM2CON0) to "1", and set TM2RUN (bit 0 of TM2CON0) to "0".
- Timer 3: Set TM3RUN (bit 0 of TM3CON0) to "0".

The count obtained in the frequency measurement mode can be used to determine the auto-reload mode timer data register value, thereby making the timer overflow to generate various signals with required cycles. During serial transmission, the timer 3 interrupt signal (TM3INT) is used as the baud rate clock.

Figure 7-6 indicates frequency measurement mode timing when timers 2 and 3 are used as a 16-bit timer.

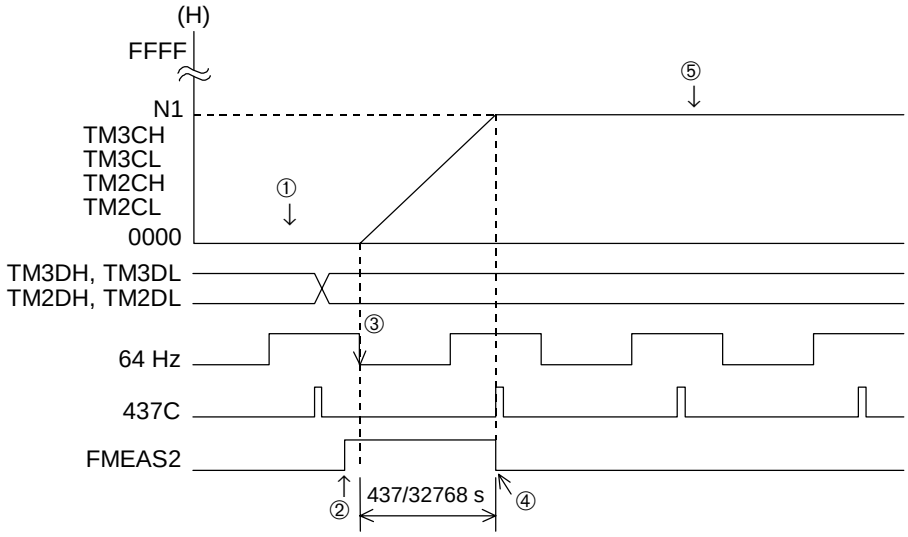

Figure 7-6 Frequency Measurement Mode Timing

The operation sequence for Figure 7-6 is as follows.

① Timer 3 control registers 0 and 1 (TM3CON0, TM3CON1) are set for 16-bit timer mode, and the timer counter and timer data register are cleared to "0". Enable the high-speed clock by the frequency control register (FCON) and the timer clock is set to HSCLK.

② Wait 10 ms or more in the ceramic oscillation mode or 300 µs or more in the RC oscillation mode after starting the high-speed clock and set FMEAS2 to "1" to enter the frequency measurement mode.

③ When FMEAS2 is "1", the counter starts at the 64 Hz falling edge.

④ When the 437C signal is "1", FMEAS2 is reset to "0", and the counter stops at the falling edge of the next clock. The 437C signal is a pulse signal which rises in 437/32768 second after the 64 Hz falling edge.

⑤ Timer counter register value N1 is read.

Assuming that the ceramic oscillation clock is exactly 2 MHz, value N1 read from the timer counter register is:

N1 = 2000000 × 437/32768
= 26672 (decimal)
= 6830 (hexadecimal)
= 0110 1000 0011 0000 (binary)
(truncated)

Because 437/32768 second is equivalent to 128 clocks at 9600 Hz (more precisely, 9598 Hz), a division of the count by 128 provides the frequency ratio (N2) between 2 MHz and 9600 Hz. Because $128 = 2^7$, that can be determined by merely truncating the righthand seven digits of N1 (binary), yielding:

N2 = 26672/128 = 011010000 (binary)
= D0 (hexadecimal)
= 208 (decimal)

This indicates that 9600 Hz is about 208 times the cycle of 2 MHz, which means that the timer data register should be set to FF30H so that the counter overflows every 208 counts of the 2 MHz clock in auto-reload mode. As a result, overflow produces a TM3INT cycle t_{TM3INT} of

$t_{TM3INT} = 1/2000000 \times 208 = 0.104$ ms (9615 Hz)

In the same way, assuming that RC oscillation clock is 600 kHz due to manufacturing variation, we get

N1 = 600000 × 437/32768 = 8001 (decimal)
= 1F41 (hexadecimal)
= 0001 1111 0100 0001 (binary)
(truncated)

Truncating the righthand seven digits of N1 (binary), we get

N2 = 8001/128 = 000111110 (binary)
= 3E (hexadecimal)
= 62 (decimal)

Set the timer data register to FFC2H so that the counter overflows every 62 counts of the 600 kHz clock in auto-reload mode. As a result, overflow produces a TM3INT cycle t_{TM3INT} of

$t_{TM3INT} = 1/600000 \times 62 = 0.10333$ ms (9677 Hz)

In this way the frequency measurement mode can be applied to generate TM3INT signals with precision cycles. These TM3INT signals can be supplied to the serial port as a baud rate clock.

Changing the value of N2 makes it possible to generate baud rates of 4800 Hz, 2400 Hz or user-defined rates. The precision of the generated baud rate clock is within ±2% for 9600 Hz, and within ±1% for 4800 Hz or lower.

Figure 7-7 illustrates the operation of baud rate clock generation for an RC oscillator clock frequency of 600 kHz.

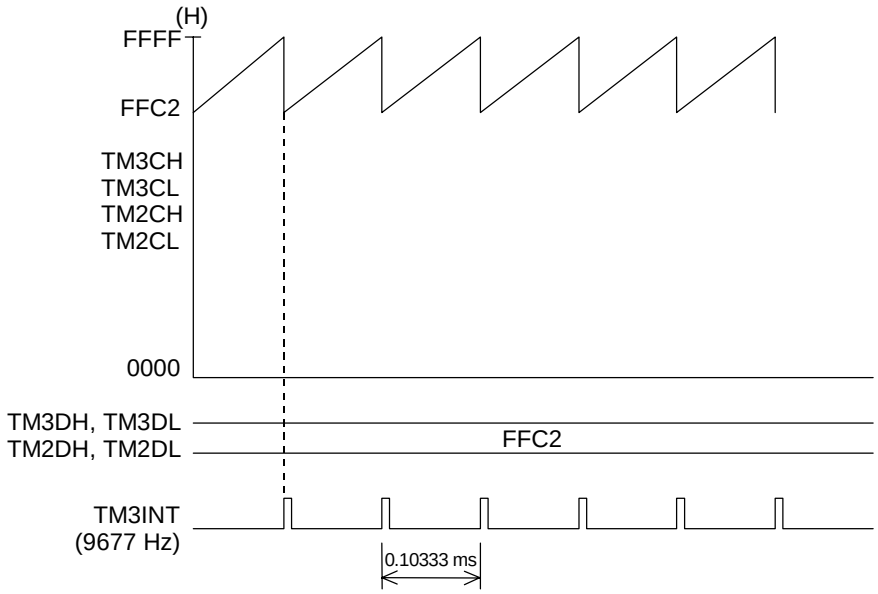

Figure 7-7 Baud Rate Clock Generation

Chapter 8

100 Hz Timer Counter (100HzTC)

8. 100 Hz Timer Counter (100HzTC)

8.1 Overview

The 100 Hz timer counter has a circuit that divides the TBC6 output (512 Hz) of the time base counter to generate a 10 Hz interrupt. The 100 Hz timer consists of a 5/6-base counter and two decimal counters.

8.2 100 Hz Timer Counter Configuration

Figure 8-1 indicates the configuration of the 100 Hz timer counter.

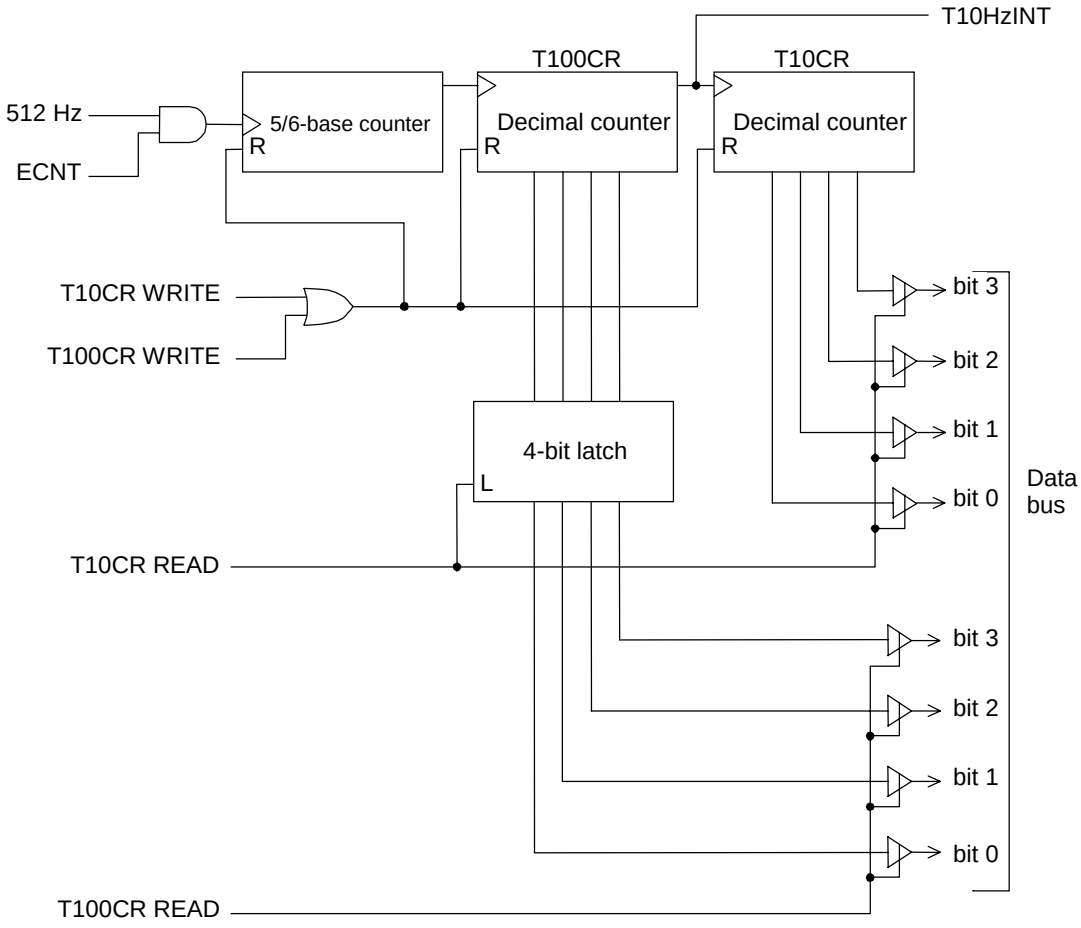

Figure 8-1 100 Hz Timer Counter Configuration

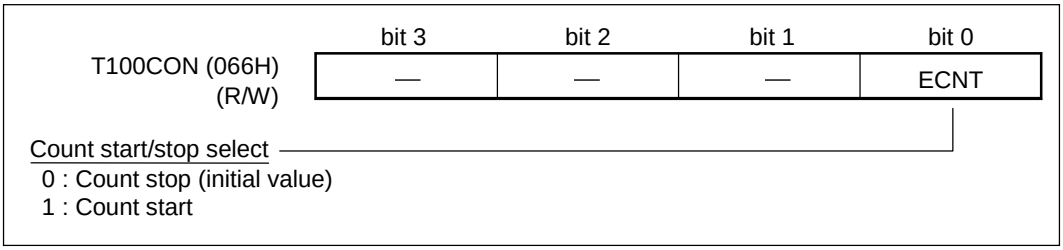
8.3 100 Hz Timer Counter Registers

(1) 100 Hz timer counter control register (T100CON)

This is a 4-bit special function register (SFR) controlling the 100 Hz timer counter.

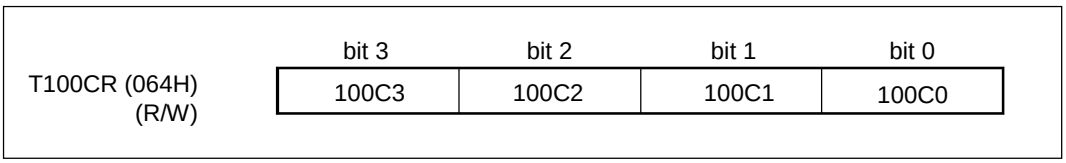


bit 0: ECNT
This bit controls count start/stop for the 100 Hz timer counter internal counter. Count starts when set to "1". At system reset the value is reset to "0" and counting is stopped.

(2) 100 Hz counter register (T100CR)

This is a 4-bit special function register (SFR) to read the 100 Hz counter of the 100 Hz timer counter. The content of the T100CR is latched by a 4-bit latch in T10CR read operation, so the value of the T100CR must always be read after reading T10CR.

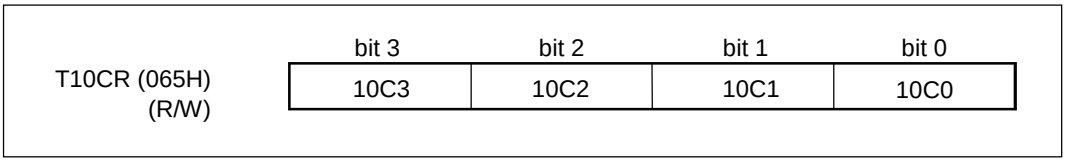
When data is written in T100CR, both T100CR and T10CR are reset to "0".



(3) 10 Hz counter register (T10CR)

A 4-bit special function register (SFR) to read the 10 Hz counter in the 100 Hz timer counter.

When data is written in T10CR, both T100CR and T10CR are reset to "0".



8.4 100 Hz Timer Counter Operation

The 100 Hz timer counter begins counting when bit 0 (ECNT) of the 100 Hz timer counter control register (T100CON) is set to "1". The 512 Hz output of the time base counter is divided into 100 Hz by the 5/6-base counter.

The 100 Hz signal is input to the 100 Hz counter (T100CR) and the carry output of that counter is input to the 10 Hz counter (T10CR). The T10HzINT signal, which is the carry output (10 Hz) of the T100CR 100 Hz counter, also generates an interrupt request, setting bit 3 (Q10Hz) of interrupt request registers 3 (IRQ3) to "1".

If either T100CR or T10CR is written to, both are reset to "0". The write data used has no significance. For example, the "MOV T100CR,A" instruction is not dependent on the contents of the accumulator.

If T10CR is read, the contents of T100CR at that time are latched to the 4-bit latch. Therefore, the contents of T100CR at the time T10CR is read can be read correctly.

Chapter 9

Watchdog Timer (WDT)

9. Watchdog Timer (WDT)

9.1 Overview

The watchdog timer is a circuit to detect CPU malfunction. The WDT consists of a 9-bit watchdog timer counter (WTDC) counting the 256 Hz output of the TBC7 of the time base counter (TBC), and a watchdog timer control register (WDTCON) to start and clear WDTC.

9.2 Watchdog Timer Configuration

Figure 9-1 shows the configuration of the watchdog timer.

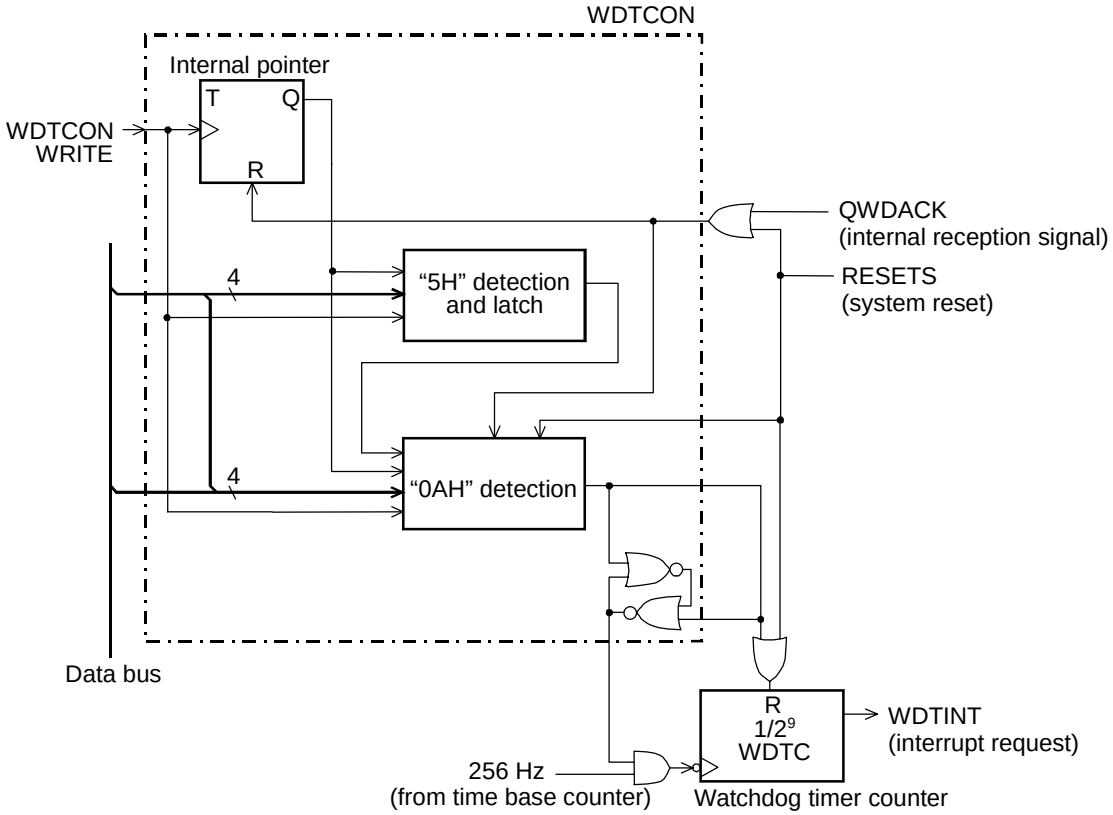


Figure 9-1 Watchdog Timer Configuration

9.3 Watchdog Timer Control Register (WDTCON)

The watchdog timer control register (WDTCON) is a 4-bit write only special function register (SFR) used to start/clear the watchdog timer counter (WDTC).

	bit 3	bit 2	bit 1	bit 0
WDTCON (09FH) (W)	d3	d2	d1	d0

9.4 Watchdog Timer Operation

At system reset, WDTC (watchdog timer counter) stops counting.

WDTC begins counting by writing "5H" to WDTCON (watchdog timer control register) while the internal pointer is "0", and then writing "0AH" (while the internal pointer is "1").

The internal pointer is cleared to "0" at system reset or when WDTC overflows, and toggles every time a write operation to WDTCON is performed.

After WDTC is activated, WDTC is cleared by writing "5H" to WDTCON while the internal pointer is "0", and then writing "0AH" while the internal pointer is "1". When WDTC overflows (1FFH→000H), a watchdog timer interrupt request (WDTINT) is generated. WDTINT cannot be disabled by the software (non-maskable interrupt) and has the highest level of interrupt priority.

The WDTC overflow cycle (T) is given by:

$$T = \frac{128 \times 512}{32768\ (\text{Hz})} = 2\ \text{s}$$

The minus deviation (t) of the WDTC overflow cycle is given by:

$$t = \frac{128}{32768\ (\text{Hz})} = \text{approximately } 3.9\ \text{ms}$$

Therefore, the WDTC clear cycle (Ct) can be computed as follows.

$$Ct = T - t = 2\ \text{s} - 3.9\ \text{ms} = 1.9961\ \text{s}$$

If 32.768 kHz is to be used as the low-speed clock, the software must be programmed to clear WDTC within 1.9961 s.

If the CPU malfunctions due to a power failure or other factor and the WDTC cannot be cleared normally, WDTC will overflow and WDTINT will be generated. Program the watchdog timer interrupt routine to handle recovery operations by returning to the normal routine.

Note:

The watchdog timer cannot detect all operating faults. If the CPU malfunctions but WDTC can still be cleared, a fault will not be detected.

Figure 9-2 shows a flowchart of watchdog timer processing.

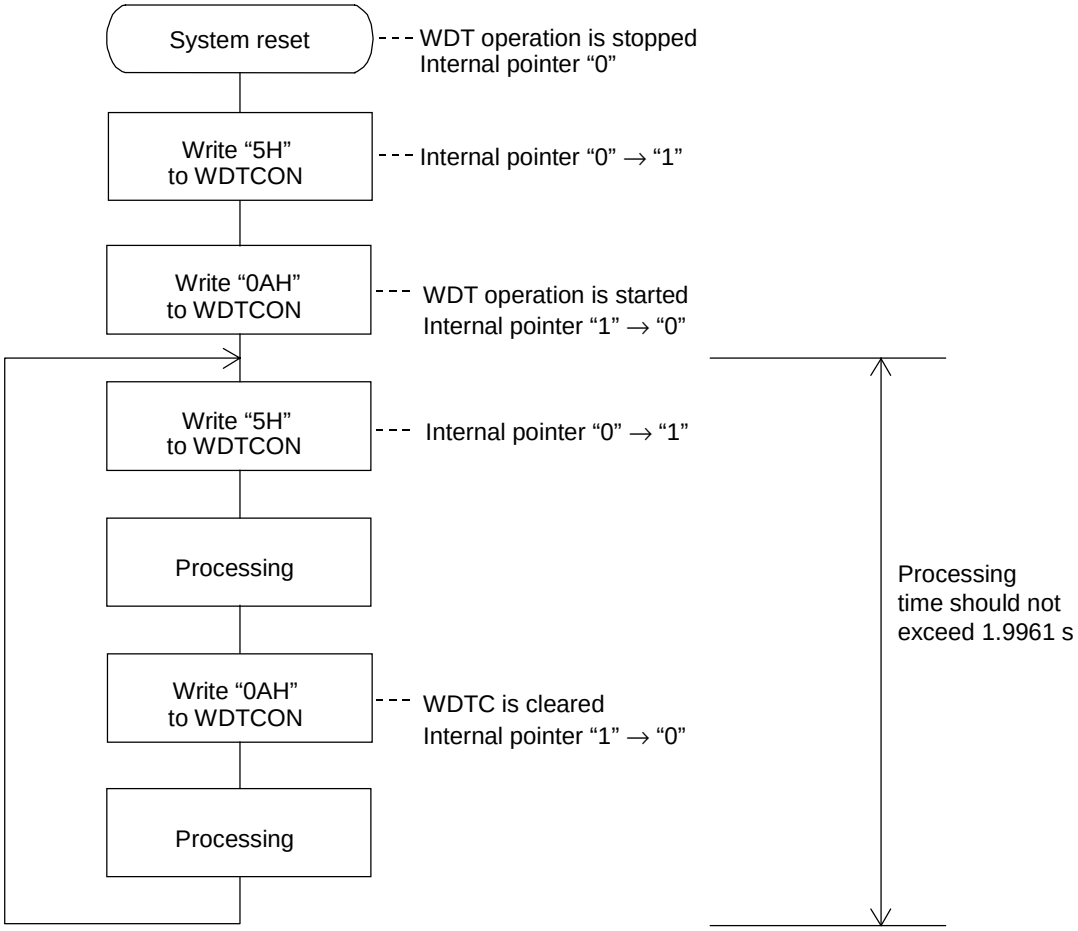

Figure 9-2 Watchdog Timer Processing Flowchart

Figure 9-3 shows the timing chart for watchdog timer operation.

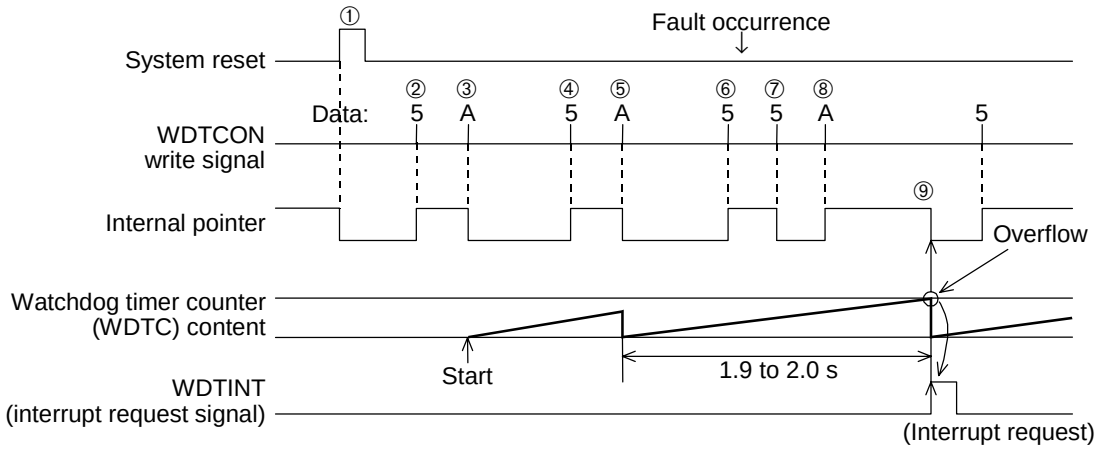

Figure 9-3 Watchdog Timer Operation Timing Chart

The watchdog timer operating sequence is shown below.

① System reset clears the internal pointer and WDTC.

② Write "5H" to WDTCON. (Internal pointer 0→1)

③ Write "0AH" to WDTCON to start WDTC. (Internal pointer 1→0)

④ Write "5H" to WDTCON. (Internal pointer 0→1)

⑤ Write "0AH" to WDTCON to clear WDTC. (Internal pointer 1→0)

⑥ Write "5H" to WDTCON. (Internal pointer 0→1)

⑦ After a fault occurs, "5H" is written to WDTCON but is not accepted since the internal pointer is "1". (Internal pointer 1→0)

⑧ "0AH" is written to WDTCON, but since the internal pointer is "0" and the write of "5H" in step ⑦ was not accepted, WDTC will not be cleared. (Internal pointer 0→1)

⑨ Because WDTC was not cleared, overflow of WDTC will generate the watchdog timer interrupt WDTINT. At this time, the internal pointer is cleared to "0".

Chapter 10

Ports (INPUT, OUTPUT, I/O PORT)

10. Ports (INPUT, OUTPUT, I/O PORT)

10.1 Overview

The ML63295A has two 4-bit input ports, six 4-bit output ports and six 4-bit I/O ports.

The V_{DDI} (interface power supply) pin supplies power to the ports.

If a port is to be connected to an external device that operates on a different power supply, the power supply of the external device must be fed to the V_{DDI} pin.

Note:

Since V_{DDI} is separated from the positive power supply pin (V_{DD}), power must be supplied to the V_{DDI} pin.

10.2 Ports List

The ports of the ML63295A are shown in Table 10-1.

Table 10-1 Ports List

Port	I/O	Interrupt	Secondary function	Page
Port 0	I	●	●	10-2
Port 1			●	
Port 2	O			10-9
Port 3				
Port 4			●	10-13

Port 8	I/O	●	●	10-21
Port 9				
Port A				
Port B		●	●	10-30
Port C		●	●	10-37
Port E		●	●	10-45

10.3 Port 0, Port 1 (P0.0–P0.3, P1.0–P1.3)

10.3.1 Port 0, Port 1 Configuration

The ML63295A has 4-bit input-only ports Port 0 and Port 1.

Figure 10-1 shows the configuration of ports 0 and 1.

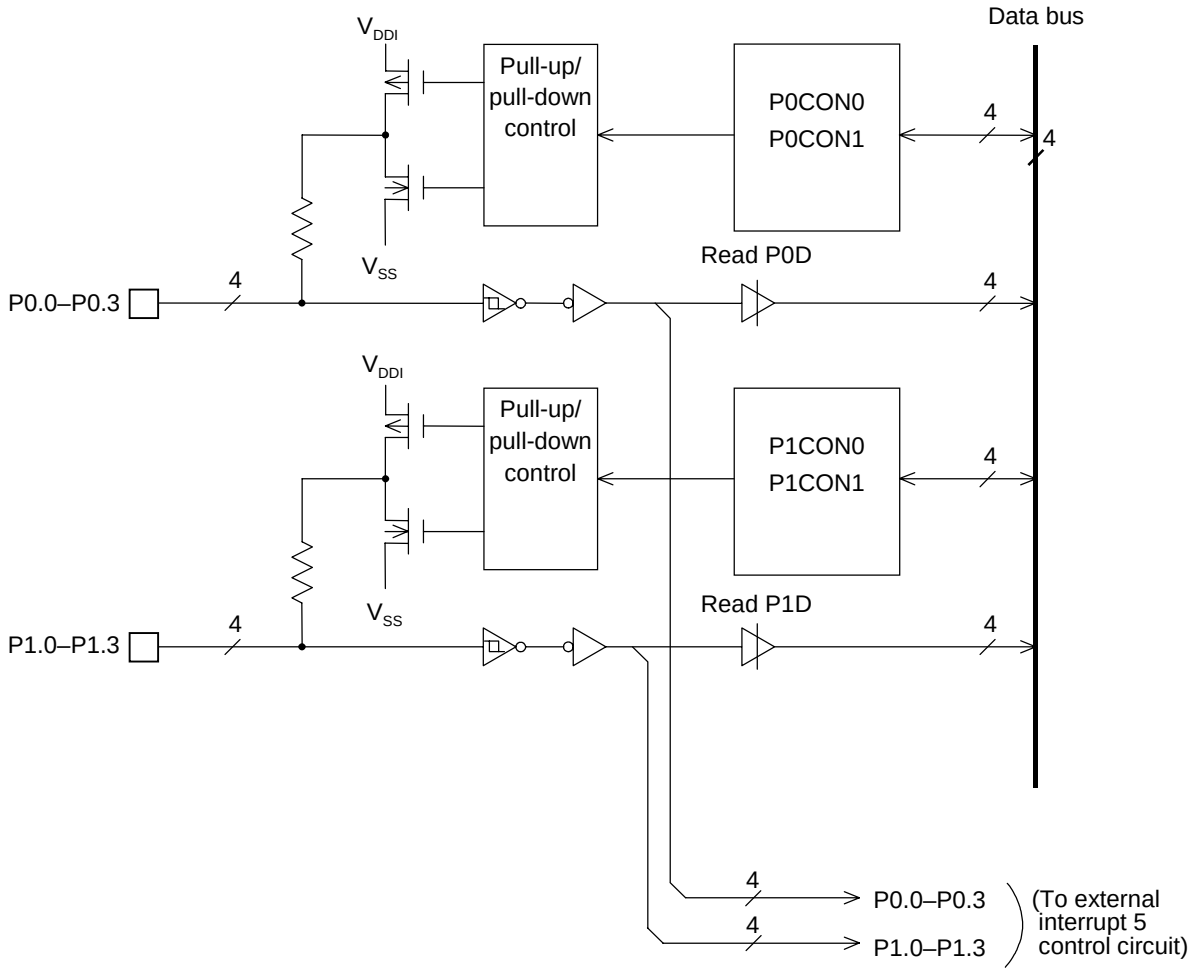

Figure 10-1 Input-Only Port (Port 0, Port 1) Configuration

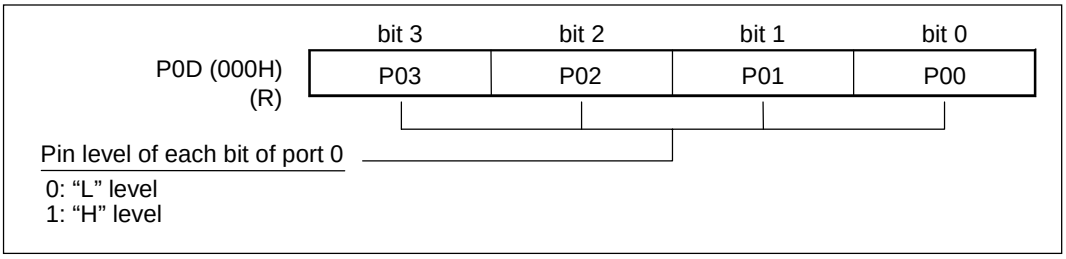
10.3.2 Port 0, Port 1 Registers

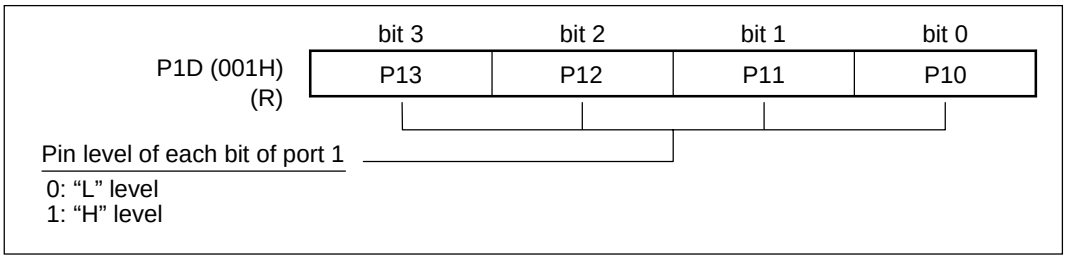
(1) Port 0, Port 1 data registers (P0D, P1D)

The port 0 data register (P0D) and the port 1 data register (P1D) are 4-bit read-only special function registers (SFRs) used to read the pin level of each bit of ports 0 and 1.

- Port 0



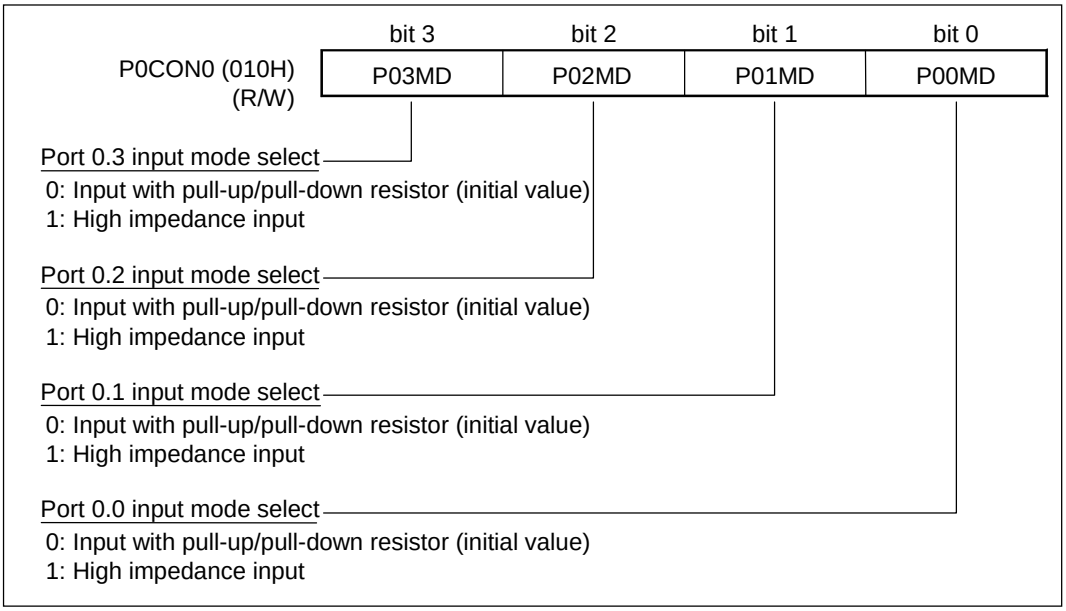
- Port 1

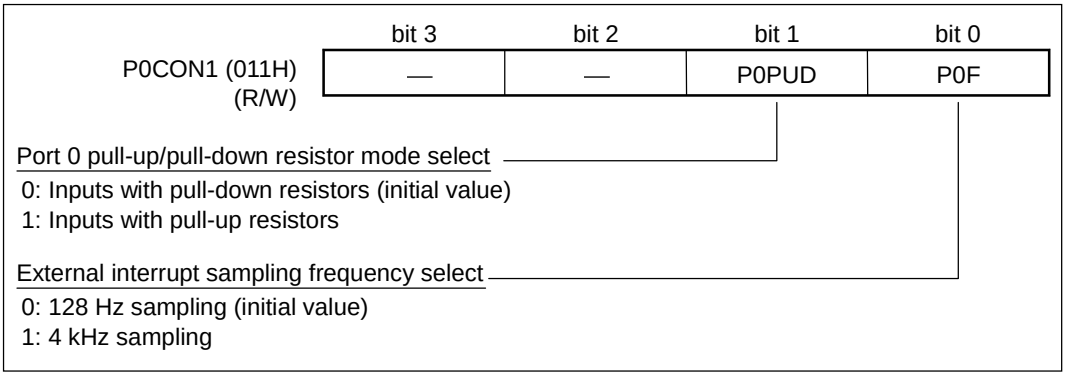


(2) Port 0, Port 1 control registers (P0CON0, P0CON1, P1CON0, P1CON1)

The port 0 control registers 0/1 (P0CON0, P0CON1) and the port 1 control registers 0/1 (P1CON0, P1CON1) are 4-bit special function registers (SFRs) that select input with pull-up or pull-down resistor for each bit and select the external interrupt sampling frequency of Ports 0 and 1 secondary function.

- Port 0

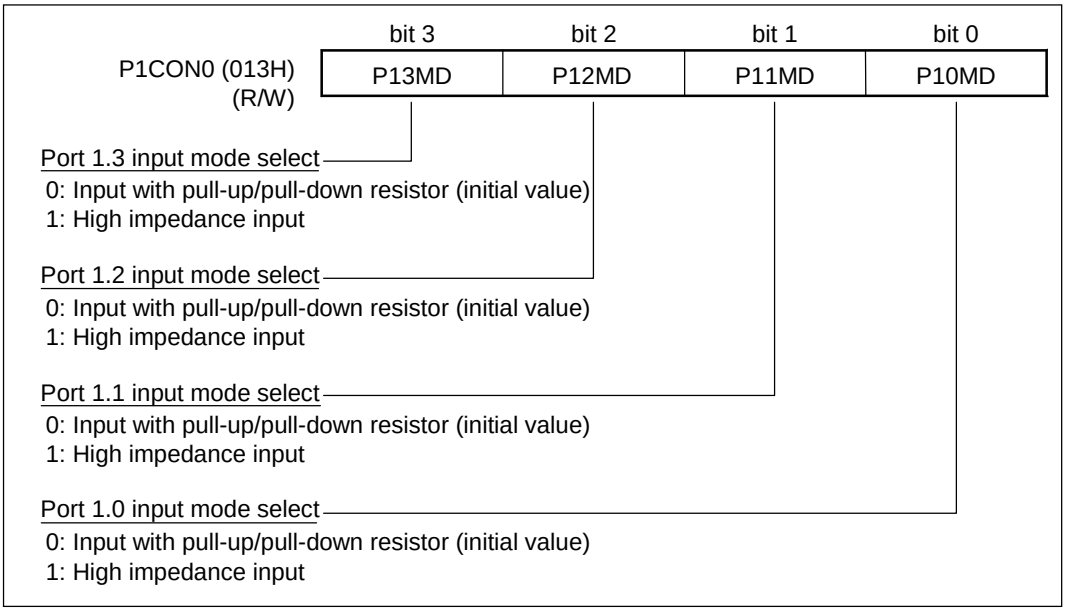


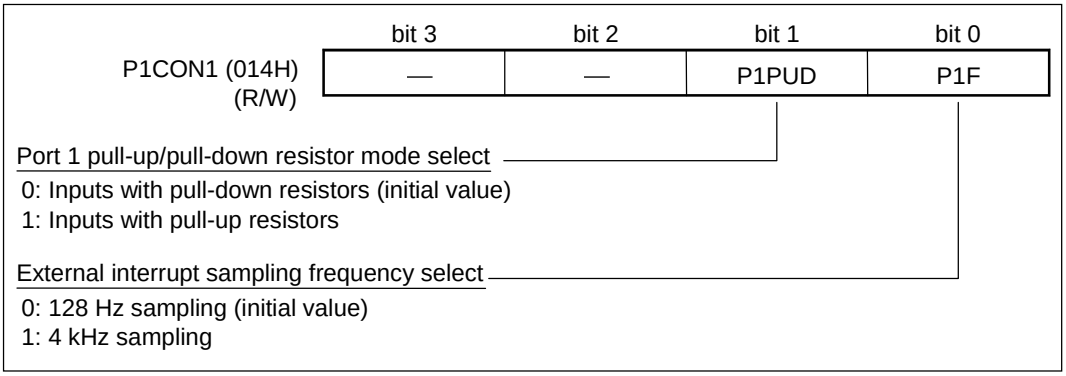


bit 1: P0PUD

This bit is used to select pull-up or pull-down resistors when any of the port 0 pins are selected by P0CON0 as an input with pull-up/pull-down resistor.
Setting P0PUD to "0" selects pull-down resistors, and setting to "1" selects pull-up resistors.
Individual specification of pull-down or pull-up resistor for the pins of port 0.0 to 0.3 is not possible.

- Port 1





bit 1: P1PUD

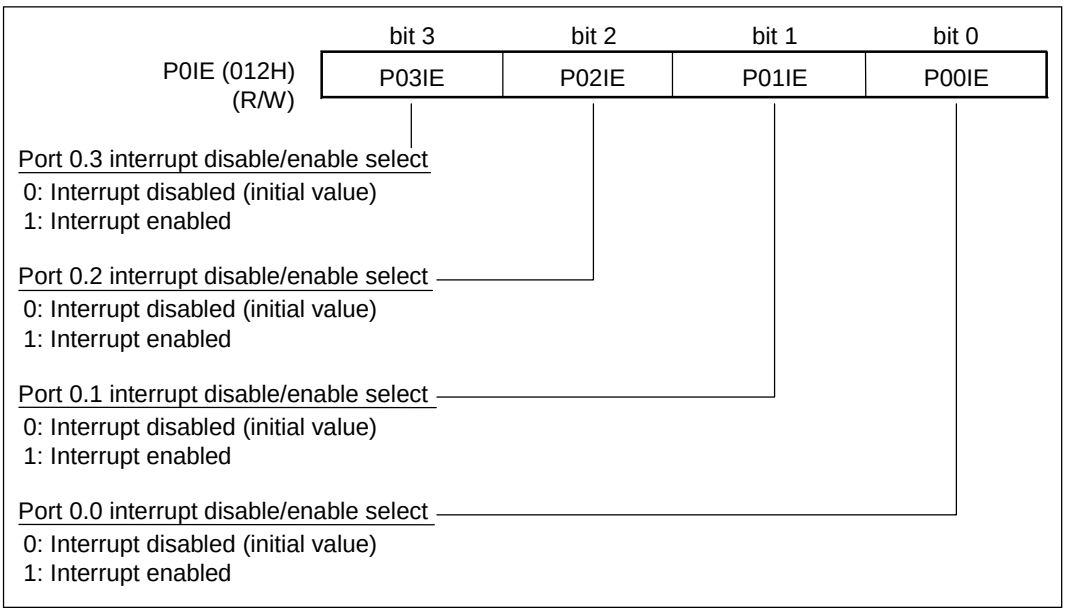
This bit is used to select pull-up or pull-down resistors when any of the port 1 pins are selected by P1CON0 as an input with pull-up/pull-down resistor.
Setting P1PUD to "0" selects pull-down resistors, and setting to "1" selects pull-up resistors.
Individual specification of pull-down or pull-up resistor for the pins of port 1.0 to 1.3 is not possible.

(3) Port 0, Port 1 interrupt enable registers (P0IE, P1IE)

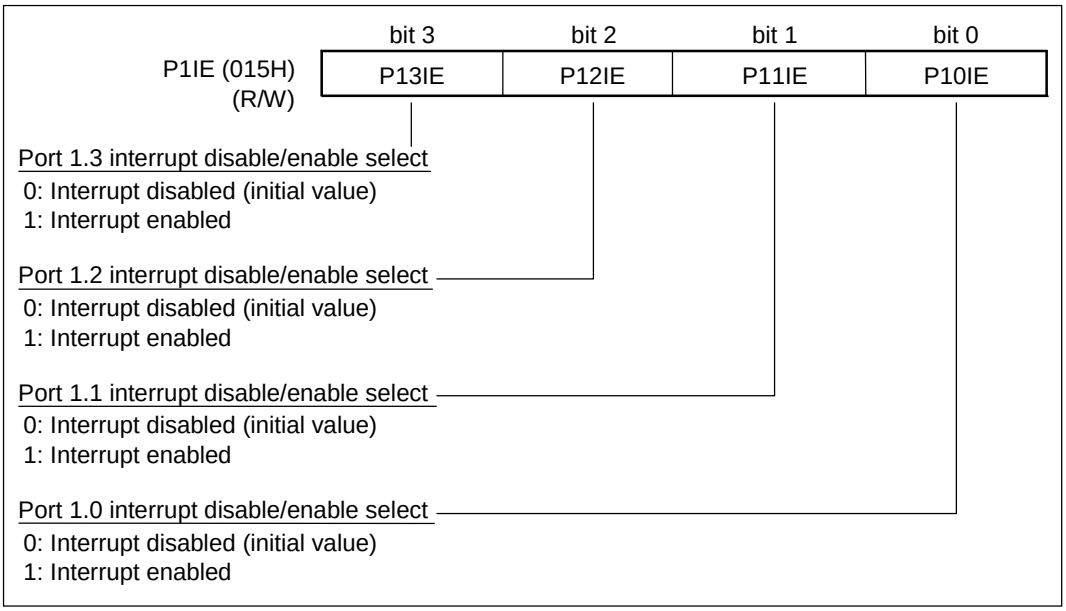
The port 0 interrupt enable register (P0IE) and the port 1 interrupt enable register (P1IE) are 4-bit special function registers (SFRs) that enable/disable individual bits when port 0 and port 1 are used as external interrupt.

At system reset, all bits in P0IE and P1IE are cleared to "0" and ports 0 and 1 are initialized to the interrupt disabled state.

- Port 0



- Port 1



10.3.3 Port 0, Port 1 External Interrupt Function (External Interrupt 5)

An external interrupt (external interrupt 5) is assigned to port 0 and port 1 as a secondary function. Individual bits can be enabled/disabled for external interrupt 5.

External interrupt generation for each input of port 0 and port 1 is triggered by the falling edge of either the 128 Hz or 4 kHz sampling clock from the time base counter.

After the port level changes, interrupt request signal XI5INT is output and external interrupt 5 request flag (QXI5) is set. The maximum time delay from the change in port level until setting QXI5 is one cycle of the sampling clock (128 Hz or 4 kHZ).

Because the port 0 and port 1 external interrupt 5 is set by a level change at any of the port 0 or port 1 inputs, each bit of the port must be read to determine which bit of port 0 or port 1 generated the interrupt.

The interrupt vector address for external interrupt 5 is 001EH.

Figure 10-2 shows an equivalent circuit of external interrupt 5 control.

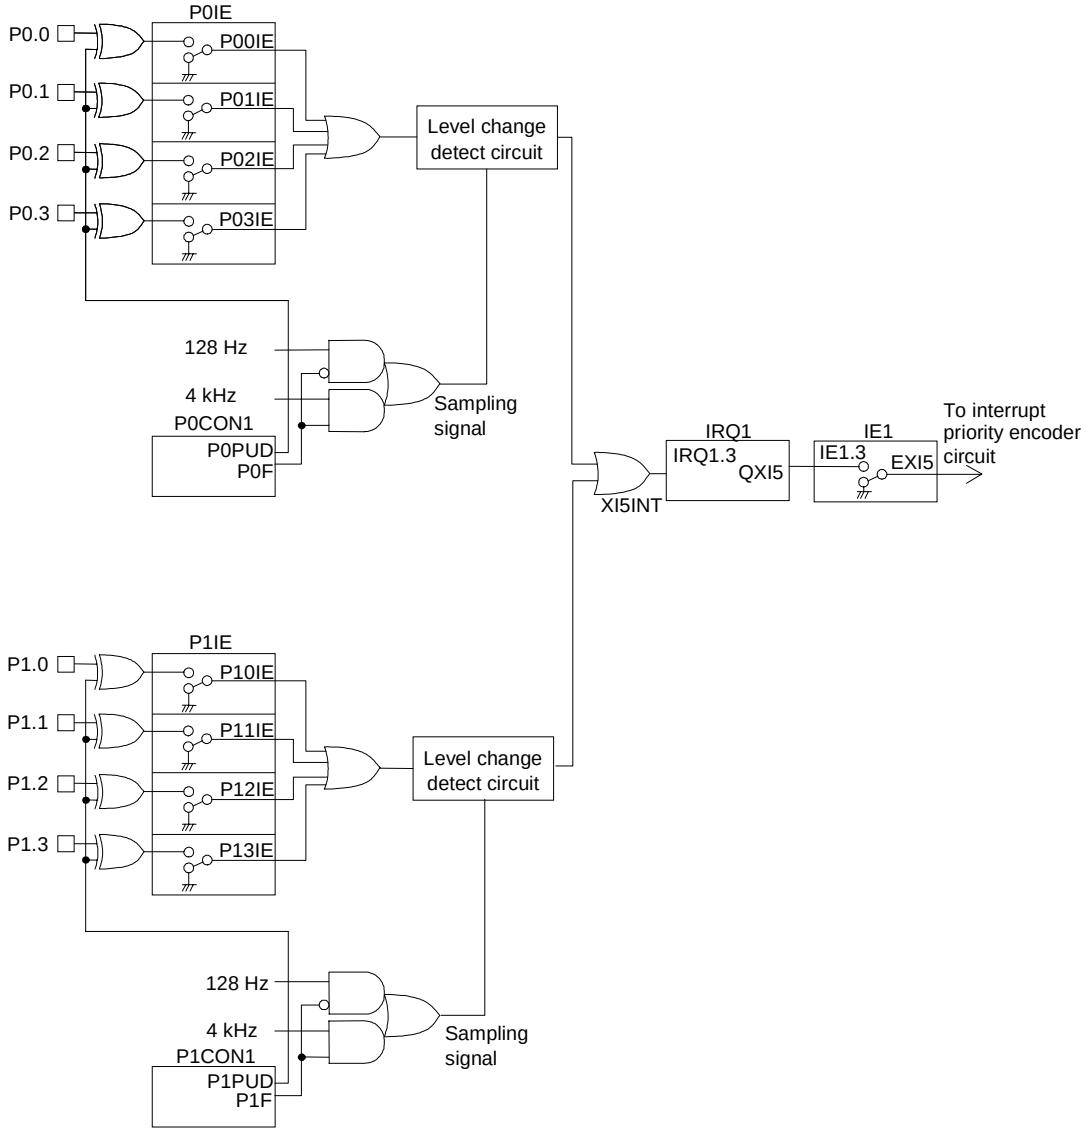


Figure 10-2 Equivalent Circuit of External Interrupt 5 Control

Figure 10-3 shows the timing for generation of external interrupt 5.

(a) P0PUD and P1PUD = "0" (initial value: inputs with pull-down resistors) setting

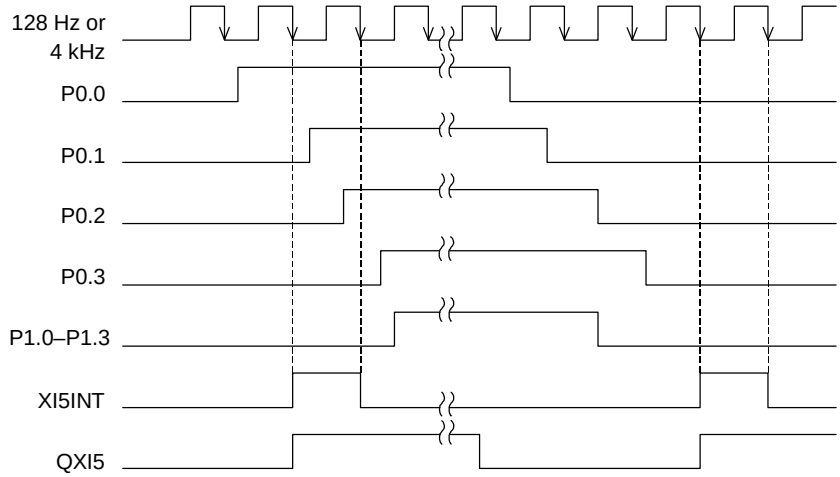
- When all P0.0 to P0.3 and P1.0 to P1.3 inputs are at a "L" level
  External interrupt 5 is generated when any port 0 or port 1 input changes to a "H" level.

- When any of P0.0 to P0.3 or P1.0 to P1.3 inputs is at a "H" level
  External interrupt 5 is generated when all the port 0 and port 1 inputs change to a "L" level.

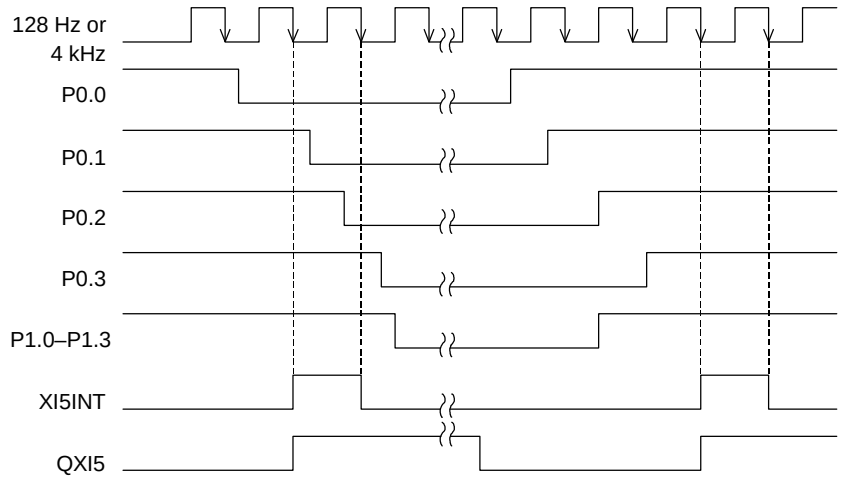
(b) P0PUD and P1PUD = "1" (inputs with pull-up resistors) setting

- When all P0.0 to P0.3 and P1.0 to P1.3 inputs are at a "H" level
  External interrupt 5 is generated when any port 0 or port 1 input changes to a "L" level.

- When any of P0.0 to P0.3 or P1.0 to P1.3 inputs is at a "L" level
  External interrupt 5 is generated when all the port 0 and port 1 inputs change to a "H" level.



(a) When P0PUD = "0" and P1PUD = "0"



(b) When P0PUD = "1" and P1PUD = "1"

Figure 10-3 Interrupt Generation Timing of External Interrupt 5

10.4 Port 2, Port 3 (P2.0–P2.3, P3.0–P3.3)

10.4.1 Port 2, Port 3 Configuration

The ML63295A has 4-bit output-only ports Port 2 and Port 3.

Figure 10-4 shows the configuration of port 2 and port 3.

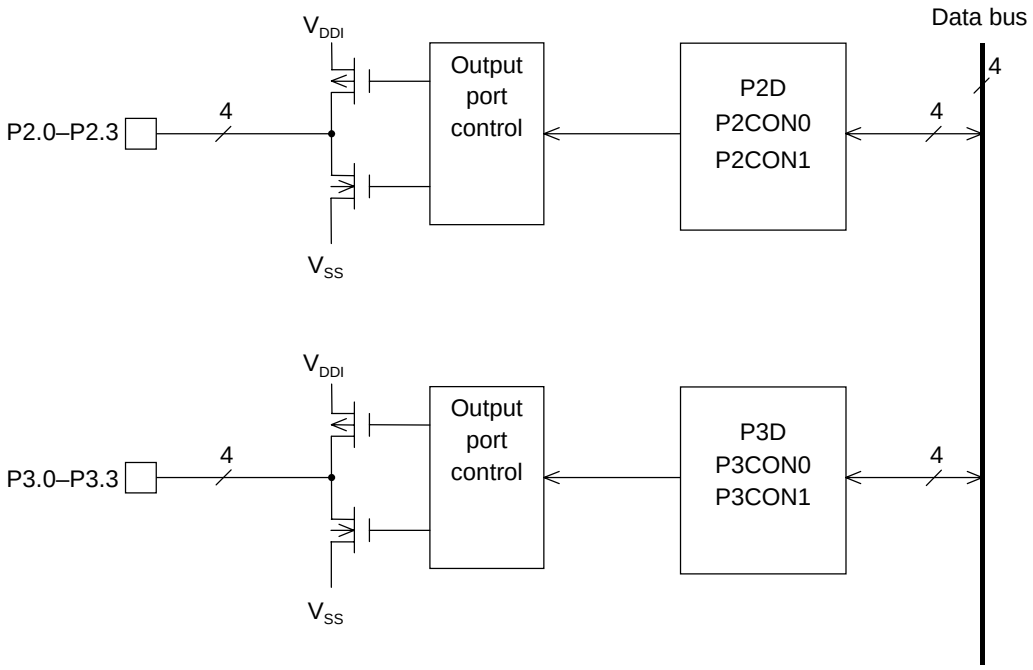


Figure 10-4 Output-Only Port (Port 2, Port 3) Configuration

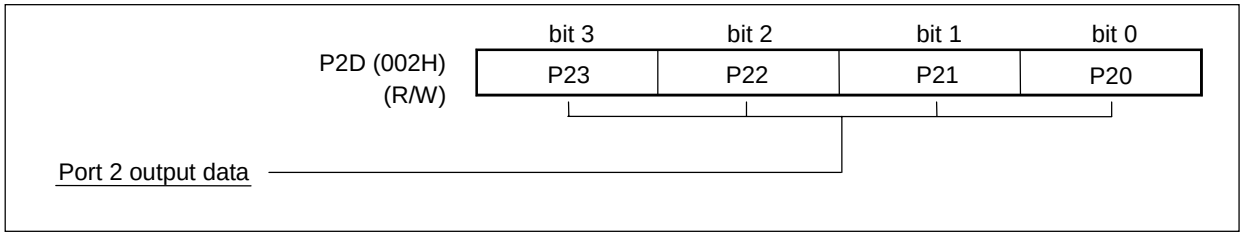
10.4.2 Port 2, Port 3 Registers

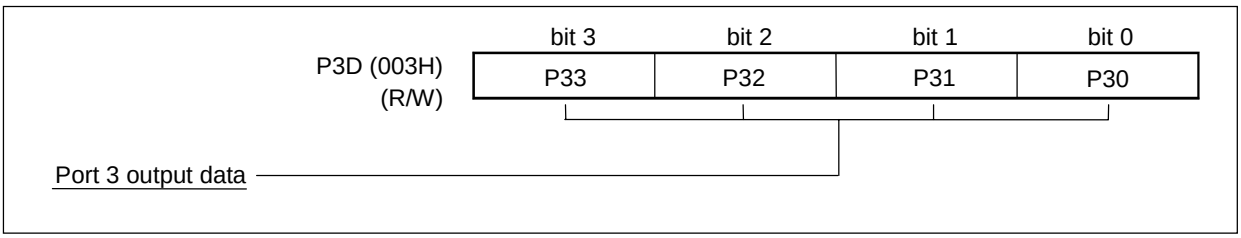
(1) Port 2, Port 3 data registers (P2D, P3D)

The port 2 data register (P2D) and port 3 data register (P3D) are 4-bit special function registers (SFRs) used to set the output values for ports 2 and 3.

- Port 2



- Port 3



At system reset all bits in the port 2 and port 3 data registers (P2D, P3D) are set to "0". When data is written to the port data register, the actual pin change timing is at the rising edge of the system clock for state 2 (S2) of the write instruction.

Figure 10-5 shows port change timing.

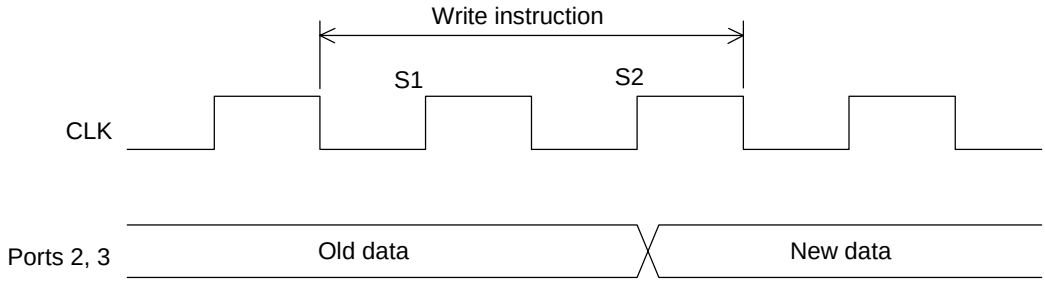


Figure 10-5 Port Change Timing

(2) Port 2, Port 3 control registers (P2CON0, P2CON1, P3CON0, P3CON1)

The port 2 control registers 0/1 (P2CON0, P2CON1) and port 3 control registers 0/1 (P3CON0, P3CON1) are 4-bit special function registers (SFRs) used to select port output modes.

The output mode may be CMOS output, N-channel open drain output, P-channel open drain output, or high-impedance output.

At system reset all bits in P2CON0, P2CON1, P3CON0 and P3CON1 are set to "0", and all ports are initialized to CMOS output mode.

10.5 Port 4, Port 5, Port 6, Port 7 (P4.0–P4.3, P5.0–P5.3, P6.0–P6.3, P7.0–P7.3)

10.5.1 Port 4, Port 5, Port 6, Port 7 Configuration

The ML63295A has 4-bit output ports Port 4, Port 5, Port 6, and Port 7.

Figure 10-6 shows the configurations of port 4, port 5, port 6 and port 7.

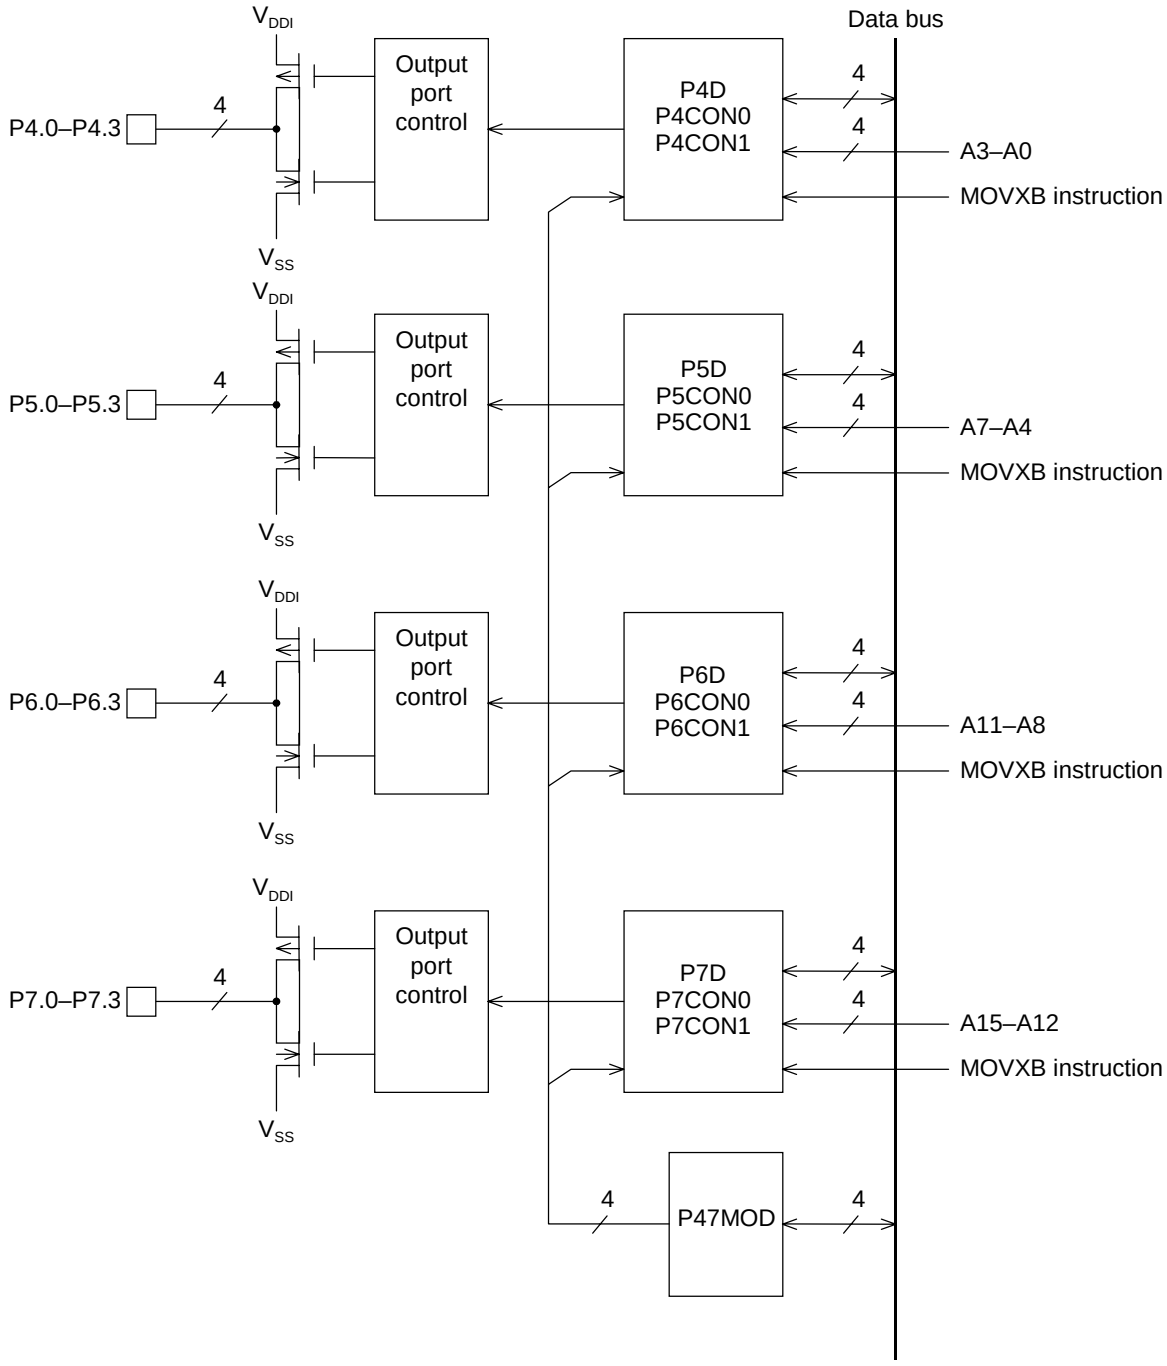

Figure 10-6 Output-Only Port (Port 4, Port 5, Port 6, Port 7) Configuration

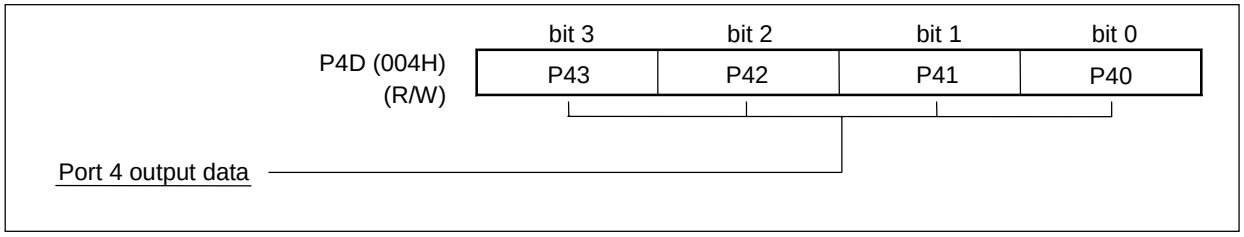
10.5.2 Port 4, Port 5, Port 6, Port 7 Registers

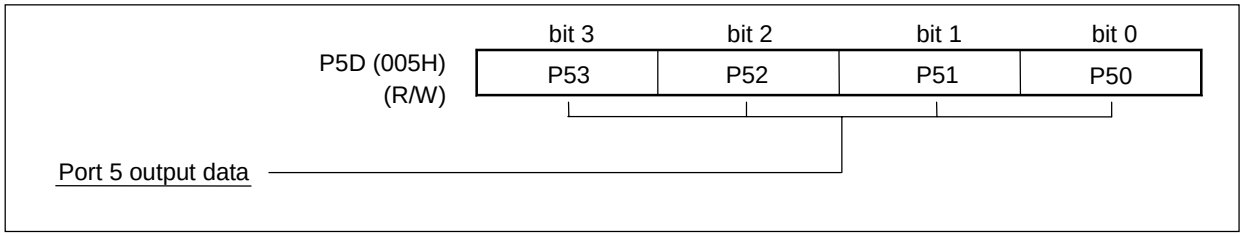
(1) Port 4, Port 5, Port 6, Port 7 data registers (P4D, P5D, P6D, P7D)

The port 4 data register (P4D), port 5 data register (P5D), port 6 data register (P6D) and port 7 data register (P7D) are 4-bit special function registers (SFRs) used to set the output values for ports 4 to 7.

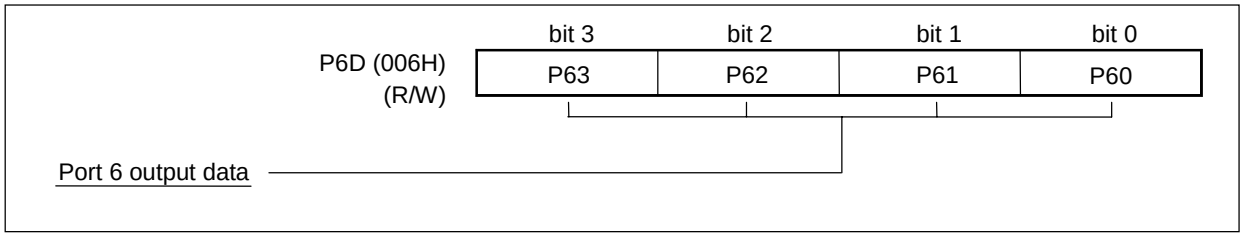
- Port 4



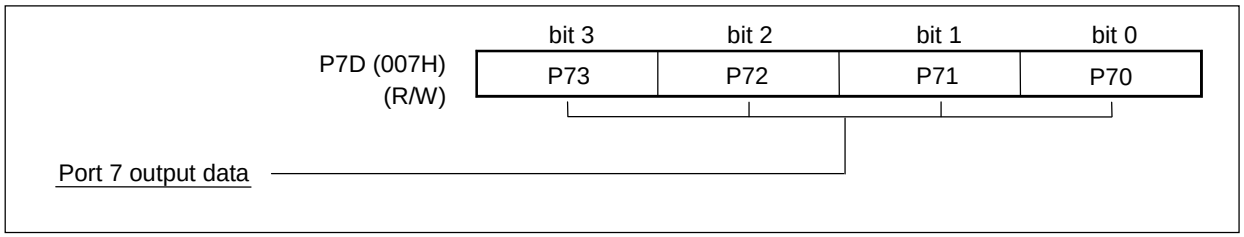
- Port 5



- Port 6



- Port 7



At system reset all bits in the port 4, port 5, port 6 and port 7 data registers (P4D, P5D, P6D, P7D) are set to "0". When data is written to a port data register, the actual pin change timing is at the positive edge of the system clock for state 2 (S2) of the write instruction.

Figure 10-7 shows port change timing.

(2) Port 4, Port 5, Port 6, Port 7 control registers (P4CON0, P4CON1, P5CON0, P5CON1, P6CON0, P6CON1, P7CON0, P7CON1)

The port 4 control registers 0/1 (P4CON0, P4CON1), port 5 control registers 0/1 (P5CON0, P5CON1), port 6 control registers 0/1 (P6CON0, P6CON1) and port 7 control registers (P7CON0, P7CON1) are 4-bit special function registers (SFRs) used to select port output mode.

The output mode may be CMOS output, N-channel open drain output, P-channel open drain output or high-impedance output.

At system reset all bits in P4CON0, P4CON1, P5CON0, P5CON1, P6CON0, P6CON1, P7CON0 and P7CON1 are set to "0", and all ports are initialized to the CMOS output mode.

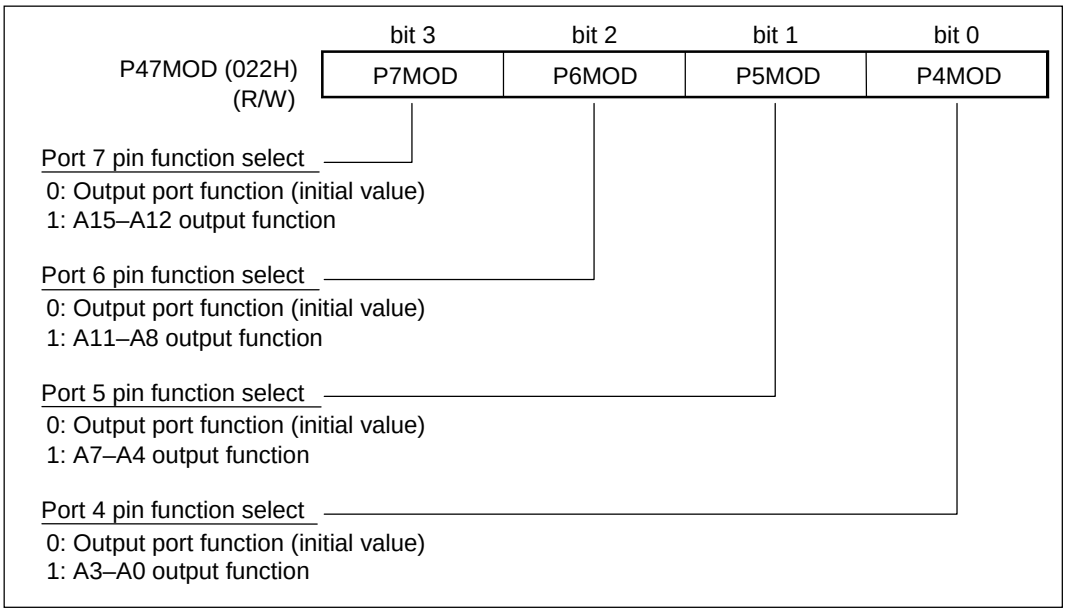
(3) Port 4, Port 5, Port 6, Port 7 mode register (P47MOD)

The port 47 mode register (P47MOD) is a 4-bit special function register (SFR) that enables the external memory address bus function, which is the secondary function of ports 4 to 7.



At system reset the P47MOD register is reset to "0", and all ports are set as normal output ports. When P47MOD bits are set to "1" and the MOVXB instruction executed, external memory addresses are output to the ports. If the MOVXB instruction is not executed, data register contents are output to the ports.

10.6 Port 8, Port 9, Port A (P8.0–P8.3, P9.0–P9.3, PA.0–PA.3)

The ML63295A has 4-bit input/output ports Port 8, Port 9 and Port A.

10.6.1 Port 8, Port 9, Port A Configuration

The circuit configurations for ports 8, 9 and A are shown in Figure 10-8.

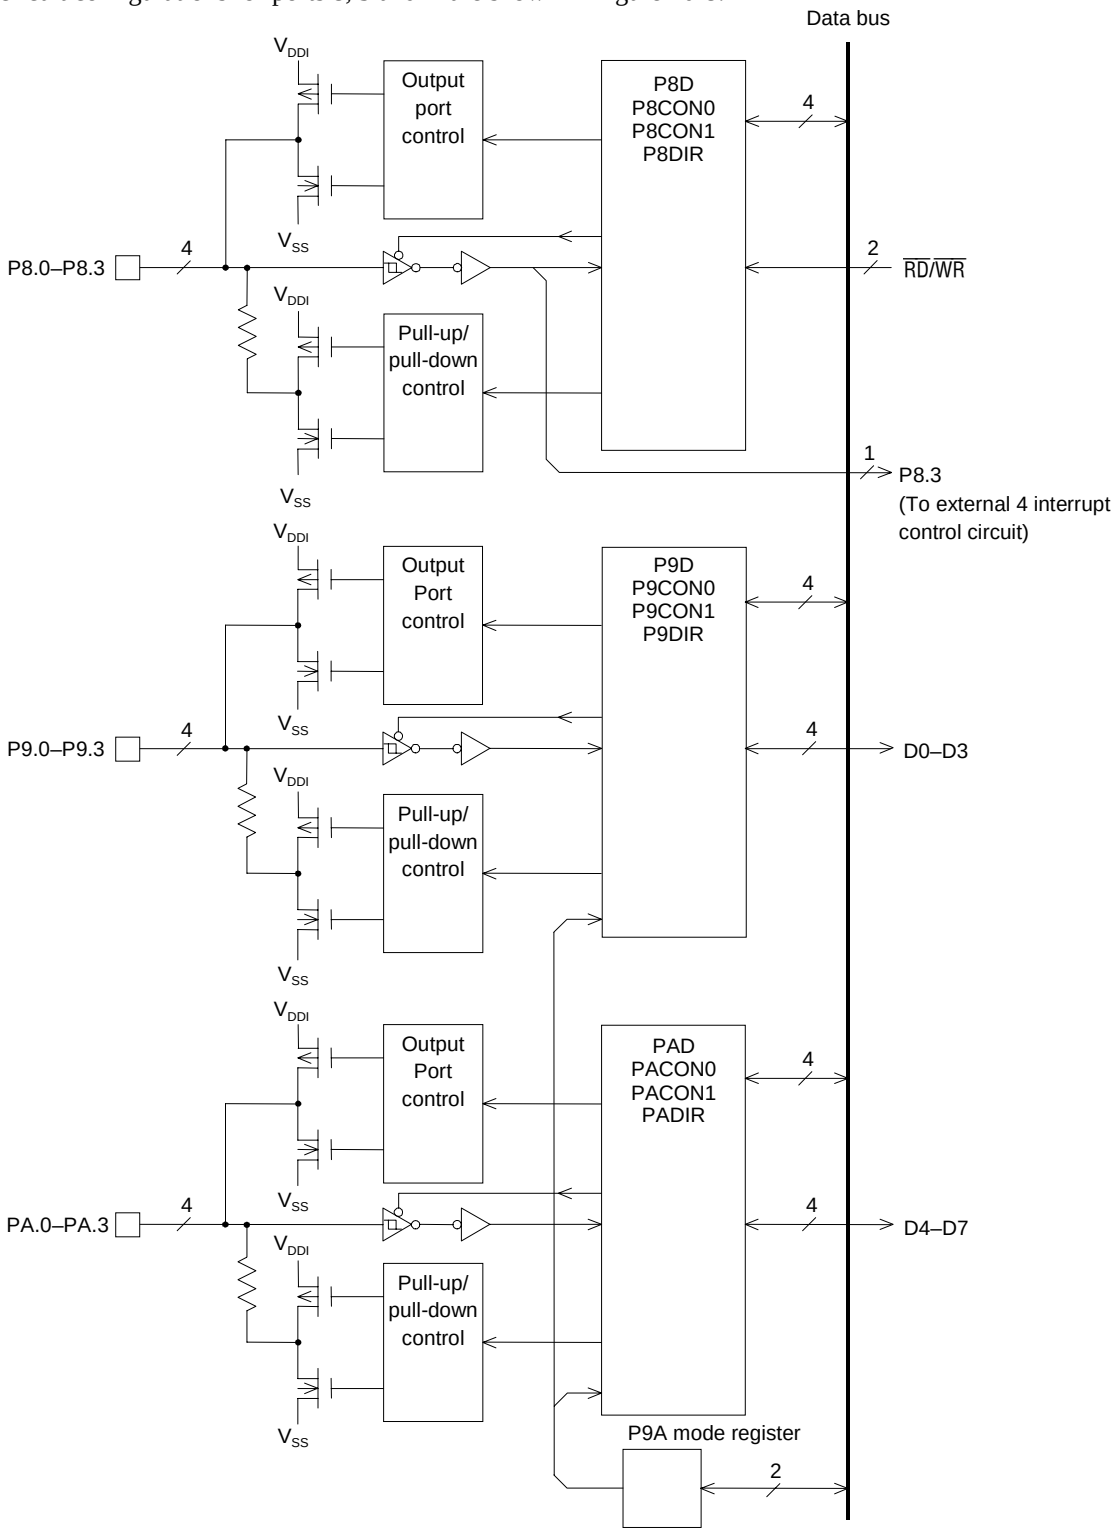


Figure 10-8 Input/Output Port (Ports 8, 9 and A) Configuration

10.6.2 Port 8, Port 9, Port A Registers

(1) Port 8, Port 9, Port A data registers (P8D, P9D, PAD)

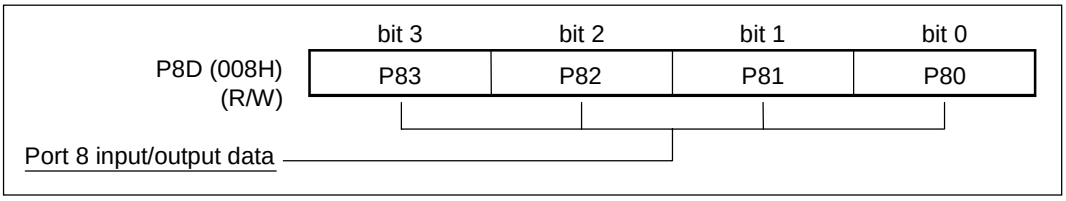
The port 8 data register (P8D), port 9 data register (P9D) and port A data register (PAD) are 4-bit special function registers (SFRs) used to set the output values for the ports.

When port direction register (P8DIR, P9DIR, PADIR) bits are set to "1" to select the output mode, the content of the corresponding port data register (P8D, P9D, PAD) is output to the port (port 8, port 9, port A).

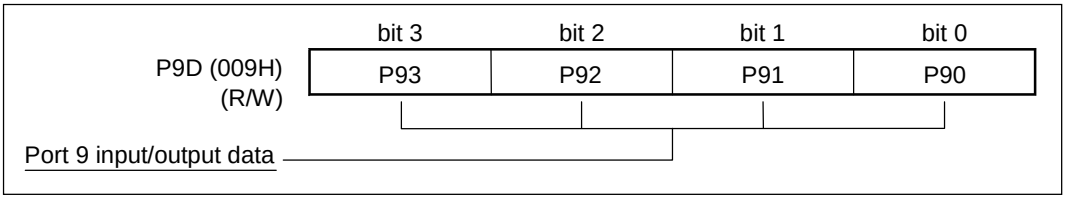
When the port data register (P8D, P9D, PAD) is read with the output mode selected, the content of the data register is read.

When the port data register (P8D, P9D, PAD) is read with port direction register bits set to "0" (input mode), the port pin levels are read.

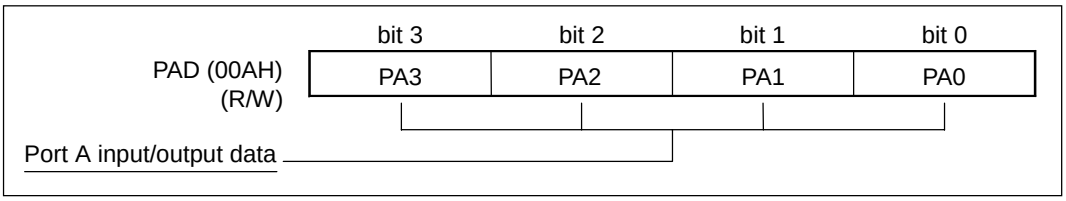
- Port 8



- Port 9



- Port A



At system reset all bits in the port 8, port 9 and A data registers are set to "0". When data is written to a port data register, the actual pin change timing is at the rising edge of the system clock for state 2 of the write instruction.
Figure 10-9 shows port change timing.

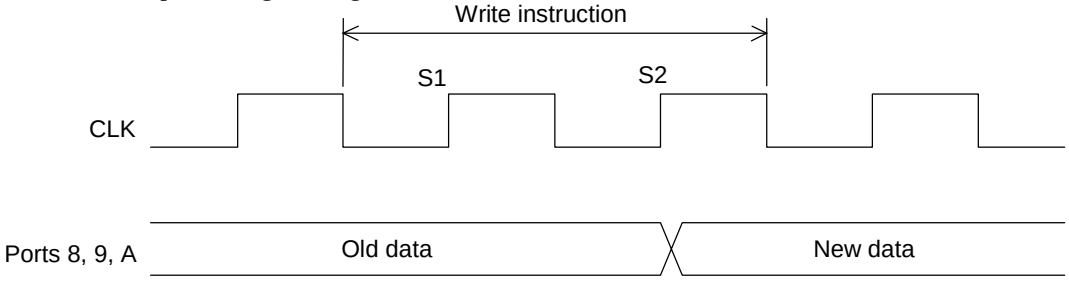


Figure 10-9 Port Change Timing

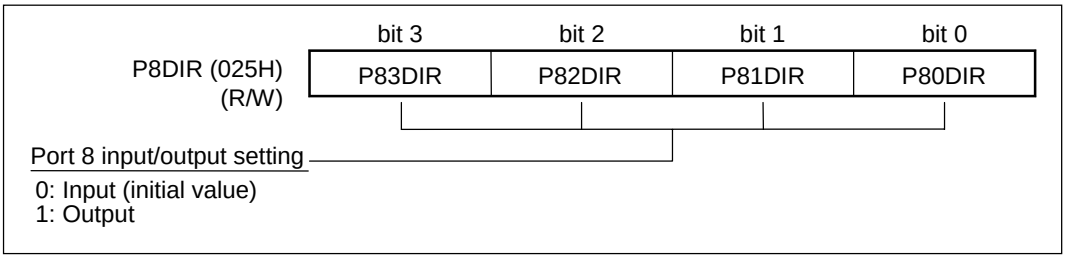
(2) Port 8, Port 9, Port A direction registers (P8DIR, P9DIR, PADIR)

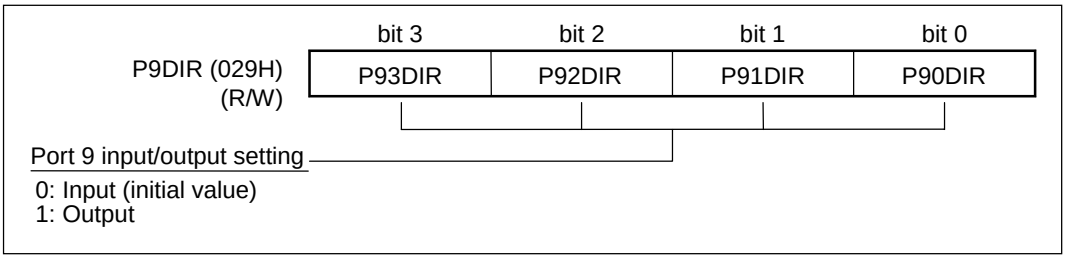
The port 8 direction register (P8DIR), port 9 direction register (P9DIR) and port A direction register (PADIR) are 4-bit special function registers (SFRs) which specify the port input/output direction for each bit. Pins corresponding to P8DIR, P9DIR and PADIR bits set to "0" are input, and those corresponding to bits set to "1" are output.

At system reset all bits in P8DIR, P9DIR and PADIR are set to "0", and ports 8, 9 and A are initialized to input mode.

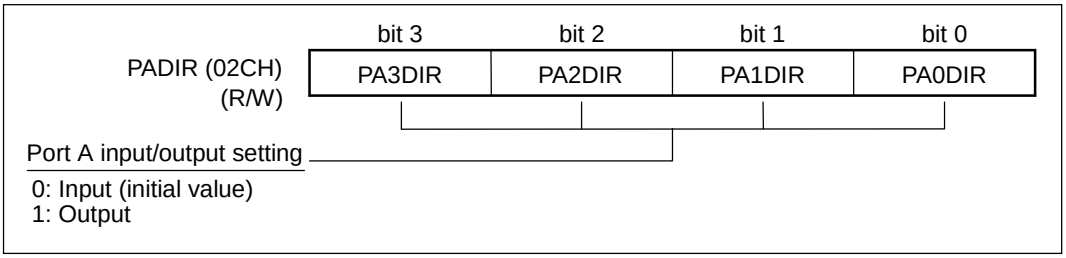
- Port 8



- Port 9



- Port A



(3) Port 8, Port 9, Port A control registers (P8CON0, P8CON1, P9CON0, P9CON1, PACON0, PACON1)

The port 8 control registers 0/1 (P8CON0, P8CON1), port 9 control registers 0/1 (P9CON0, P9CON1) and port A control registers 0/1 (PACON0, PACON1) are 4-bit special function registers (SFRs) used to select port input/output mode.

The input mode may be pull-down resistor input, pull-up resistor input or high-impedance input.

The output mode may be CMOS output, N-channel open drain output, P-channel open drain output or high-impedance output.

(4) Port 8, Port 9, Port A mode registers (P8MOD, P9AMOD)

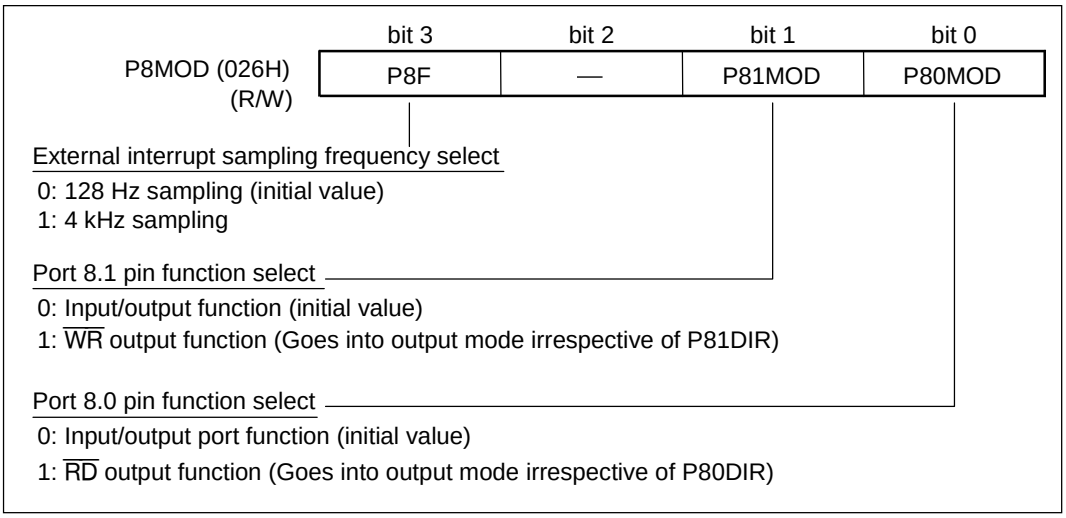
The port 8 mode register (P8MOD) and port 9A mode register (P9AMOD) are 4-bit special function registers (SFRs) used to select the sampling frequency when P8.3 is used for external interrupt and the secondary function of each port.

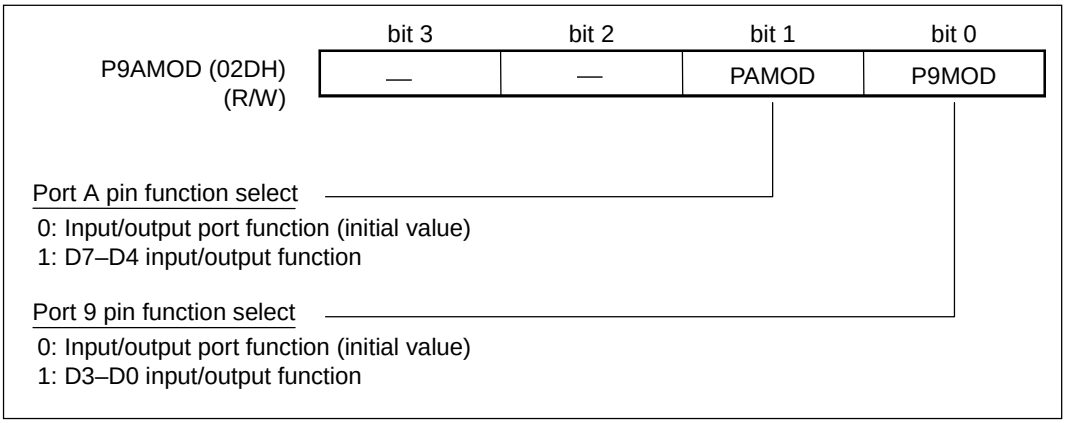
At system reset the port mode registers (P8MOD, P9AMOD) are set to "0", and ports 8, 9 and A are used as normal ports.

The port secondary functions are indicated in Table 10-2.

Table 10-2 Secondary Port Functions

Port	Secondary function	Description
P8.0	$\overline{RD}$	External memory read signal
P8.1	$\overline{WR}$	External memory write signal
P8.2	—	
P8.3	INT4	External interrupt 4
P9.0	D0	External memory data bus
P9.1	D1	
P9.2	D2	
P9.3	D3	
PA.0	D4	
PA.1	D5	
PA.2	D6	
PA.3	D7	





If each bit of P9AMOD is set to "1" and the MOVXB instruction is executed, P9 through PA perform data signaling for external memory.

Input or output is based on the contents of the MOVXB instruction. If the MOVXB instruction is not executed, P9 through PA perform the normal input/output port function.

10.6.3 Port 8.3 External Interrupt Function (External Interrupt 4)

Port 8.3 has external interrupt 4 allocated as secondary function.

External interrupt generation for P8.3 is triggered by the falling edge of the 128 Hz or 4 kHz time base counter, which is the sampling clock.

After the port level changes, the interrupt request signal (XI4INT) is output, and the interrupt request flag (QXI4) is set. The maximum delay for this sequence is one cycle of the sampling clock (128 Hz or 4 kHz).

The interrupt start address for external interrupt 4 is 001CH.

Figure 10-10 shows the equivalent circuit for external interrupt 4 control.

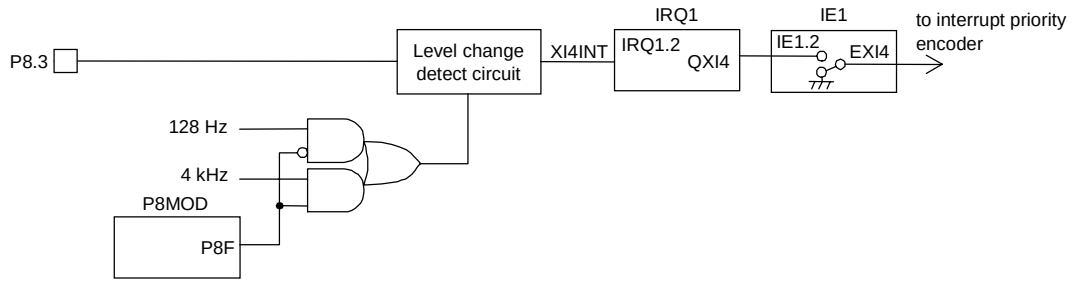


Figure 10-10 External Interrupt 4 Control Equivalent Circuit

Figure 10-11 shows the external interrupt 4 generation timing.

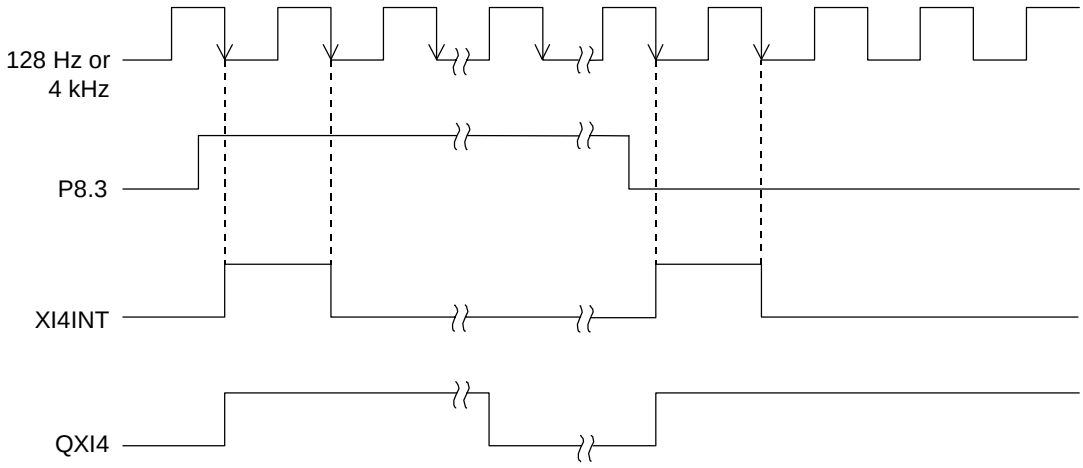

Figure 10-11 External Interrupt 4 Generation Timing

10.7 Port B (PB.0–PB.3)

The ML63295A has Port B, a 4-bit input/output port.

10.7.1 Port B Configuration

The circuit configuration for port B is shown in Figure 10-12.

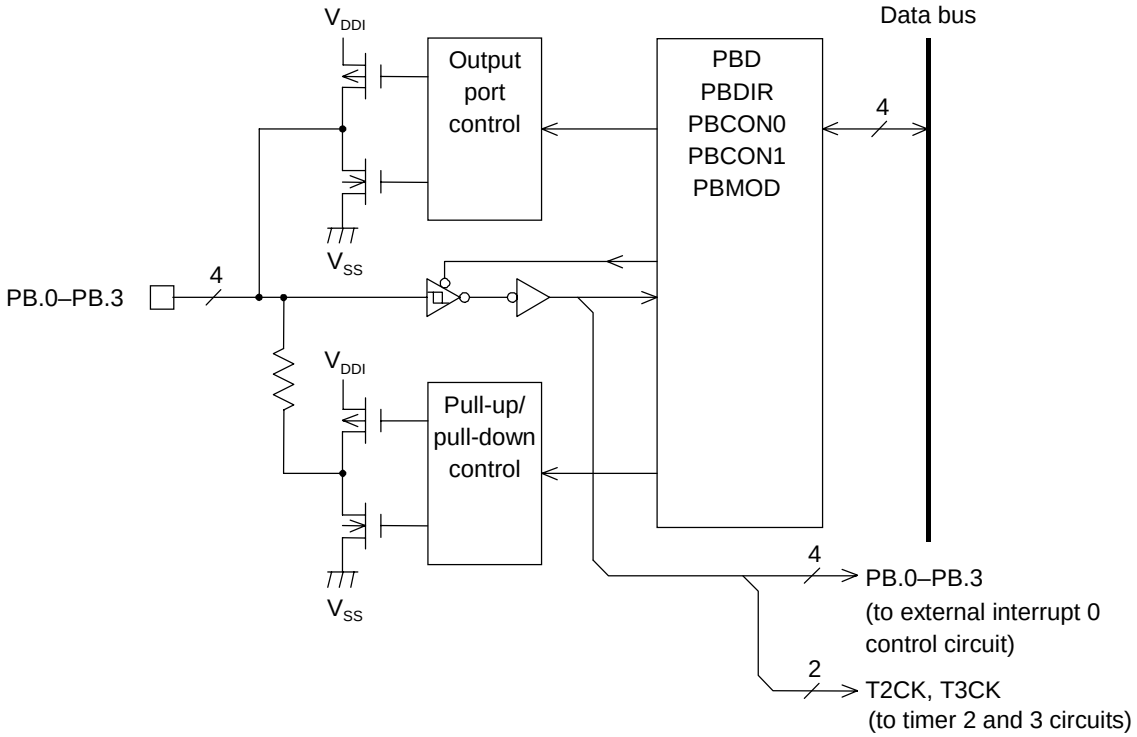

Figure 10-12 Input/Output Port (Port B) Configuration

10.7.2 Port B Registers

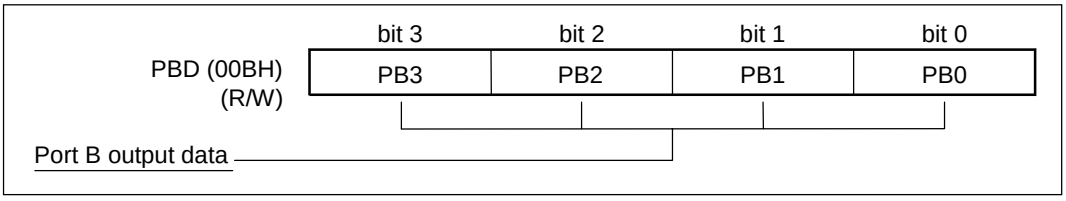
(1) Port B data register (PBD)

PBD is a 4-bit special function register used to set the output values for port B.

When port B direction register (PBDIR) bits are set to "1" to select the output mode, the content of the port B data register is output to port B.

When the port B data register is read with the output mode selected, the content of the port B data register is read.

When the port B data register is read with PBDIR bits set to "0" (input mode), the pin levels of port B are read.



At system reset all bits in the port B data register (PBD) are set to "0". When data is written to the port B data register, the actual pin change timing is at the rising edge of the system clock for state 2 of the write instruction.

Figure 10-13 indicates port change timing.

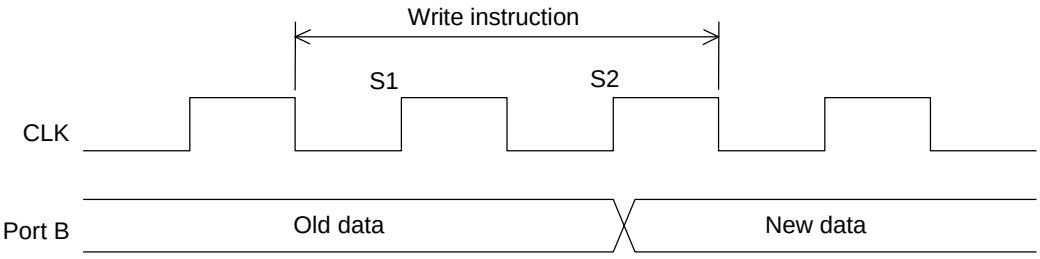


Figure 10-13 Port B Change Timing

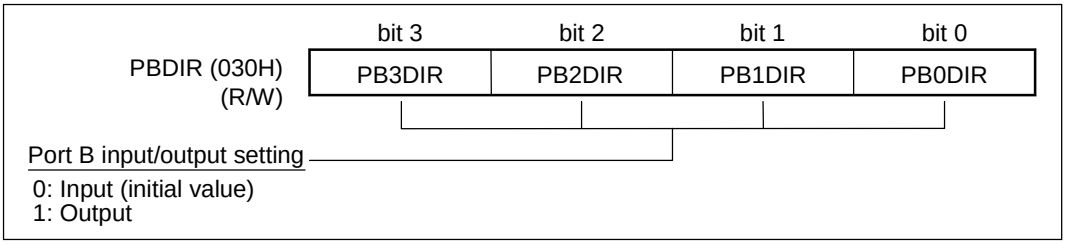
(2) Port B direction register (PBDIR)

PBDIR is a 4-bit special function register (SFR) which specifies the port input/output direction for each bit. Pins corresponding to the PBDIR bits set to "0" are input, and those corresponding to the PBDIR bits set to "1" are output.

At system reset all bits in the port B direction register are set to "0", and port B is initialized to input mode.



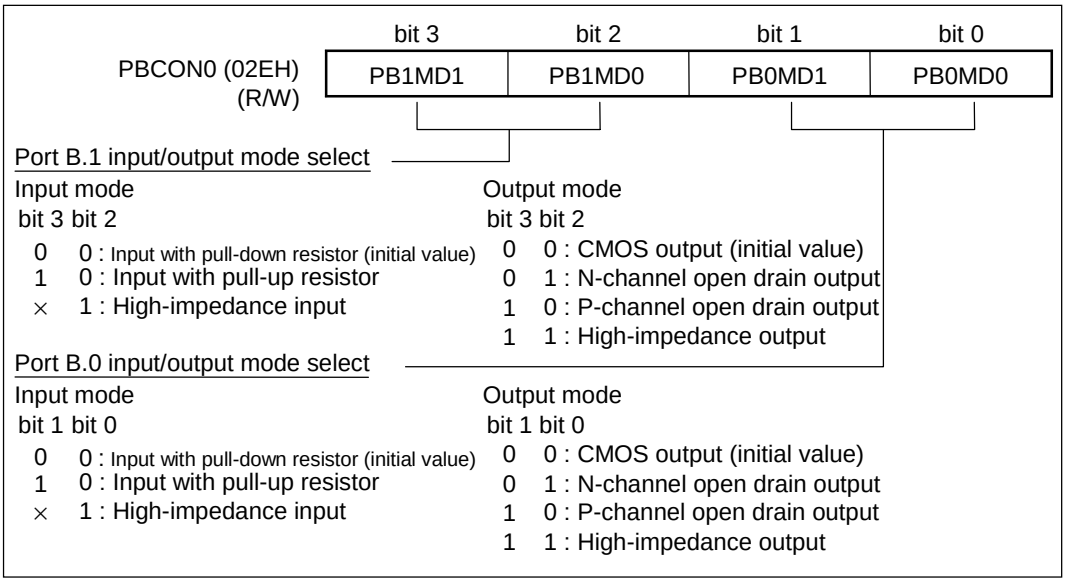
(3) Port B control registers 0/1 (PBCON0, PBCON1)

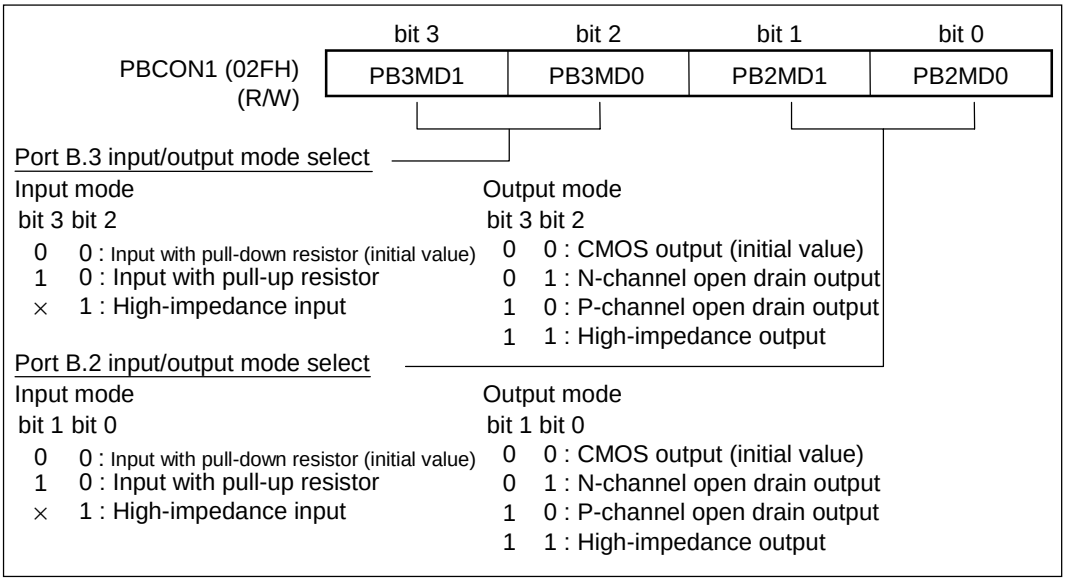
PBCON0 and PBCON1 are 4-bit special function registers (SFRs) used to select port input/output mode.

The input mode can be pull-down resistor input, pull-up resistor input or high-impedance input.

The output mode can be CMOS output, N-channel open drain output, P-channel open drain output or high-impedance output.

At system reset all bits in PBCON0 and PBCON1 are set to "0", and port B is initialized to pull-down resistor input mode and CMOS output mode.





(4) Port B mode register (PBMOD)

PBMOD is a 4-bit special function register (SFR) used to select the sampling frequency when port B is used as an external interrupt. It is also used to select port B secondary functions other than external interrupt.

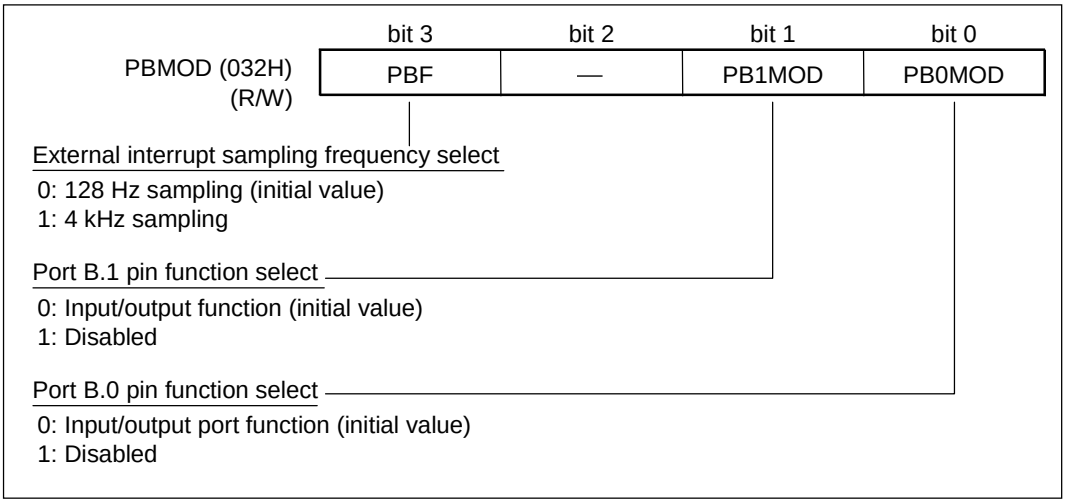
The external interrupt sampling frequency can be selected as either 128 Hz or 4 kHz.

At system reset all the valid bits in PBMOD are initialized to "0".

Port B secondary functions are indicated in Table 10-3.

Table 10-3 Port B Secondary Functions

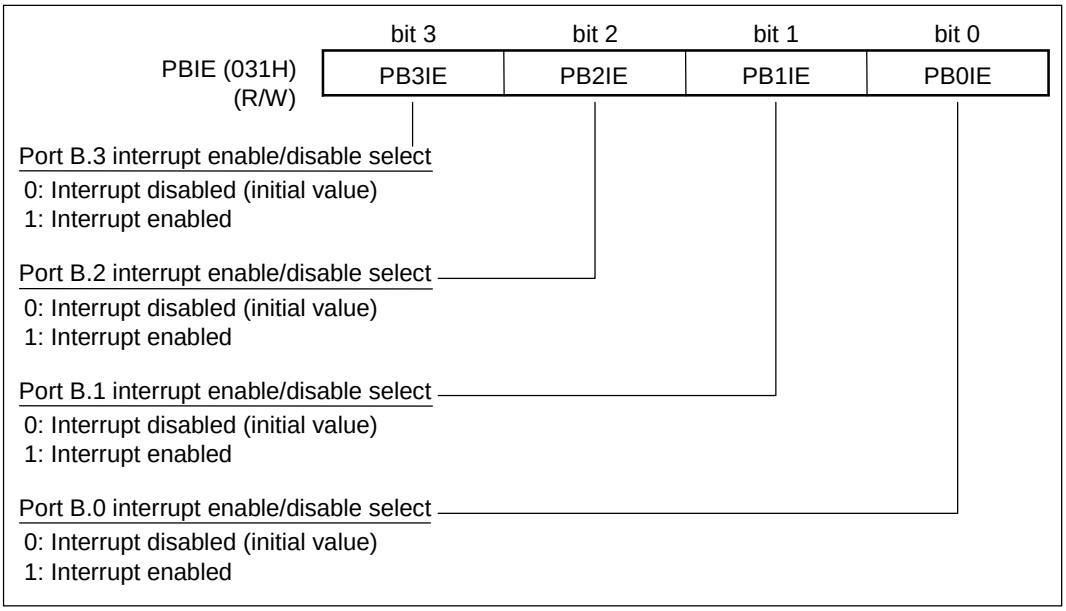
Port	Secondary function	Description
PB.2	T2CK	Timer 2 external clock input
PB.3	T3CK	Timer 3 external clock input
PB.0	INT0	External interrupt 0
PB.1		
PB.2		
PB.3		



(5) Port B interrupt enable register (PBIE)

PBIE is a 4-bit special function register (SFR) that enables/disables individual bits when port B is used as an external interrupt input.

At system reset, all bits in PBIE are set to "0" and port B is initialized to the interrupt disabled state.



10.7.3 Port B External Interrupt Function (External Interrupt 0)

Port B has external interrupt 0 allocated as secondary function. Individual bits can be enabled/disabled for external interrupt 0.

External interrupt generation for port B is triggered by the falling edge of the 128 Hz or 4 kHz time base counter, which is the sampling clock.

After the port level changes, the interrupt request signal (XI0INT) is output, and the interrupt request flag (QXI0) is set. The maximum delay for this sequence is one cycle of the sampling clock (128 Hz or 4 kHz).

Because the port B external interrupt is set by a level change at any of the port B inputs, each bit of the port must be read to determine which bit of port B generated the interrupt.

The interrupt start address for external interrupt 0 is 0014H.

Figure 10-14 shows the equivalent circuit for external interrupt 0 control.

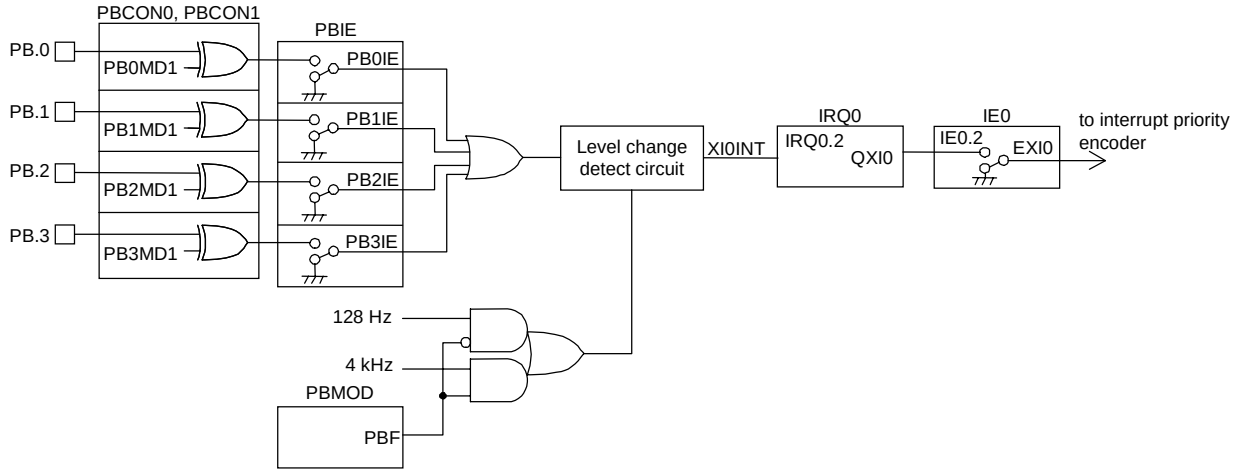


Figure 10-14 External Interrupt 0 Control Equivalent Circuit

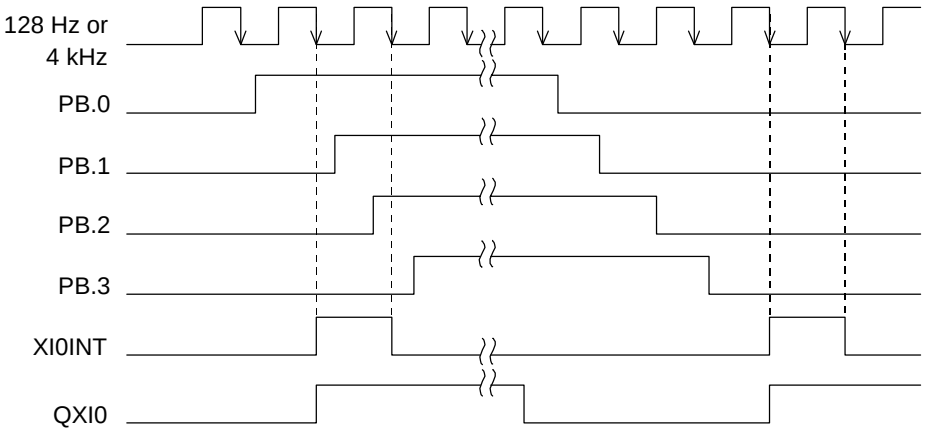
Figure 10-15 shows the external interrupt 0 generation timing.

(a) PB0MD1 to PB3MD1 = "0" (initial value: inputs with pull-down resistors or high impedance input) setting

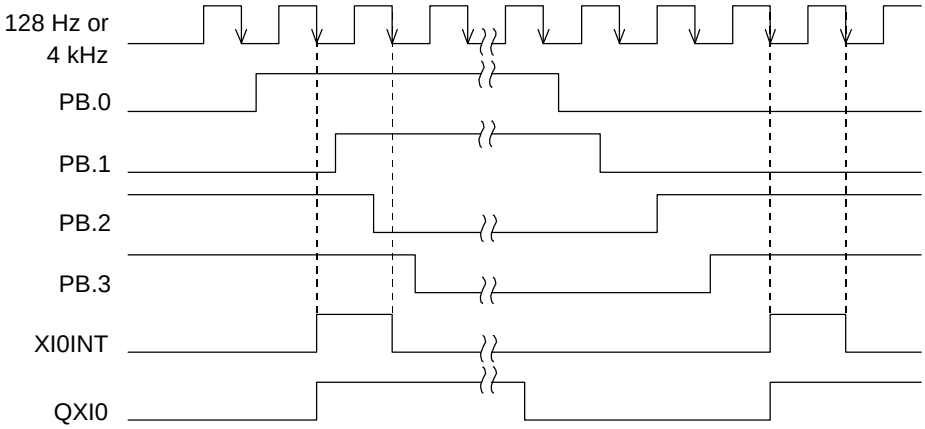
- When all PB.0 to PB.3 inputs are at a "L" level
  External interrupt 0 is generated when any port B input changes to a "H" level.
- When any of PB.0 to PB.3 inputs is at a "H" level
  External interrupt 0 is generated when all the port B inputs change to a "L" level.

(b) PB0MD1 and PB1MD1 = "0" and PB2MD1 and PB3MD1 = "1" (PB.0 and PB.1 selected as inputs with pull-down resistors or high impedance input; PB.2 and PB.3 selected as inputs with pull-up resistors or high impedance input) setting

- When both PB.0 and PB.1 inputs are at a "L" level AND both PB.2 and PB.3 inputs are at a "H" level
  External interrupt 0 is generated when either PB.0 or PB.1 input changes to a "H" level (alternatively, when either PB.2 or PB.3 input changes to a "L" level).
- When either PB.0 or PB.1 input is at a "H" level OR either PB.2 or PB.3 input is at a "L" level
  External interrupt 0 is generated when both PB.0 and PB.1 inputs change to a "L" level AND both PB.2 and PB.3 inputs change to a "H" level.



(a) When PB0MD1 to PB3MD1 = "0"



(b) When PB0MD1 and PB1MD1 = "0" and PB2MD1 and PB3MD = "1"

Figure 10-15 Interrupt Generation Timing of External Interrupt 0

10.8 Port C (PC.0–PC.3)

The ML63295A has Port C, a 4-bit input/output port.

10.8.1 Port C Configuration

The circuit configuration for port C is shown in Figure 10-16.

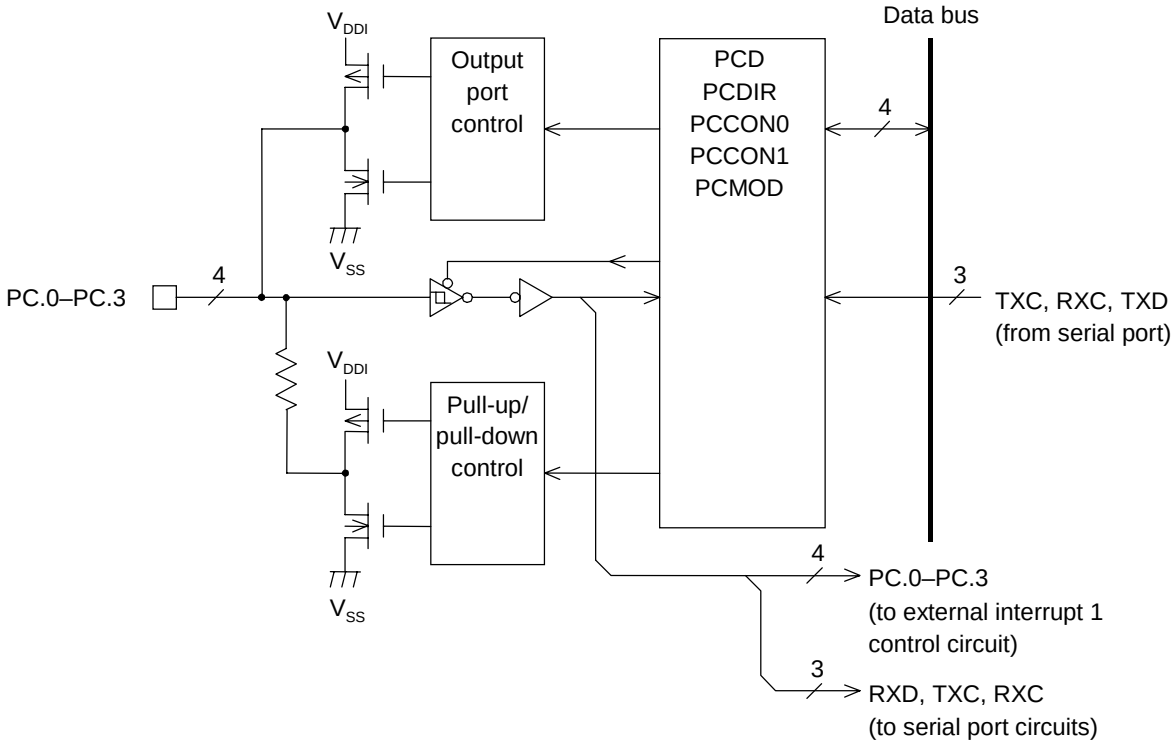


Figure 10-16 Input/Output Port (Port C) Configuration

10.8.2 Port C Registers

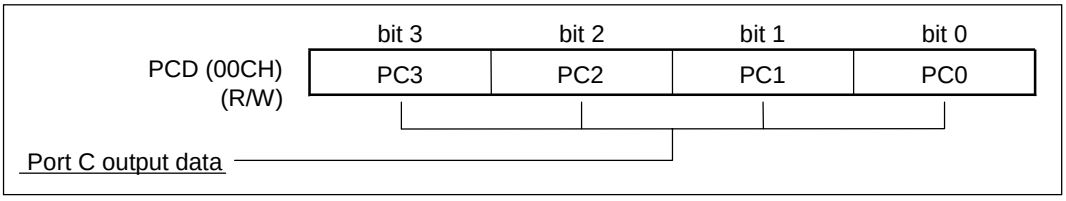
(1) Port C data register (PCD)

PCD is a 4-bit special function register used to set the output values for port C.

When port C direction register (PCDIR) bits are set to "1" to select the output mode, the content of the port C data register is output to port C.

When the port C data register is read with the output mode selected, the content of the port C data register is read.

When the port C data register is read with PCDIR bits set to "0" (input mode), the pin levels of port C are read.



At system reset all bits in the port C data register (PCD) are set to "0". When data is written to the port C data register, the actual pin change timing is at the rising edge of the system clock for state 2 of the write instruction.

Figure 10-17 indicates port change timing.

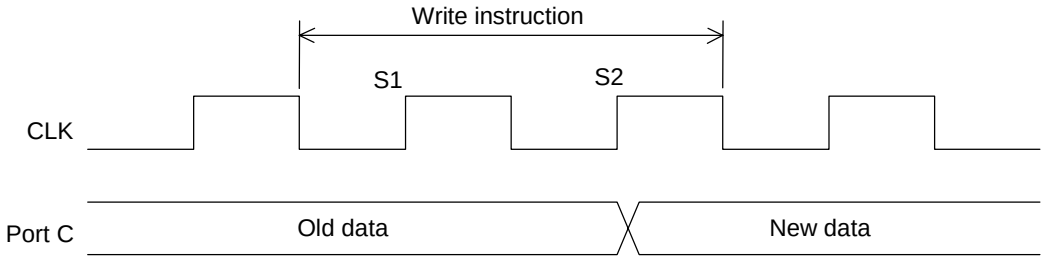


Figure 10-17 Port C Change Timing

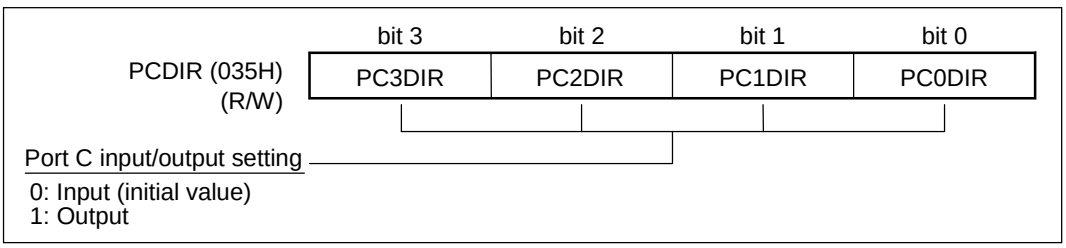
(2) Port C direction register (PCDIR)

PCDIR is a 4-bit special function register (SFR) which specifies the port input/output direction for each bit. Pins corresponding to the PCDIR bits set to "0" are input, and those corresponding to the PCDIR bits set to "1" are output.

At system reset all bits in the port C direction register are reset to "0", and port C is initialized to input mode.



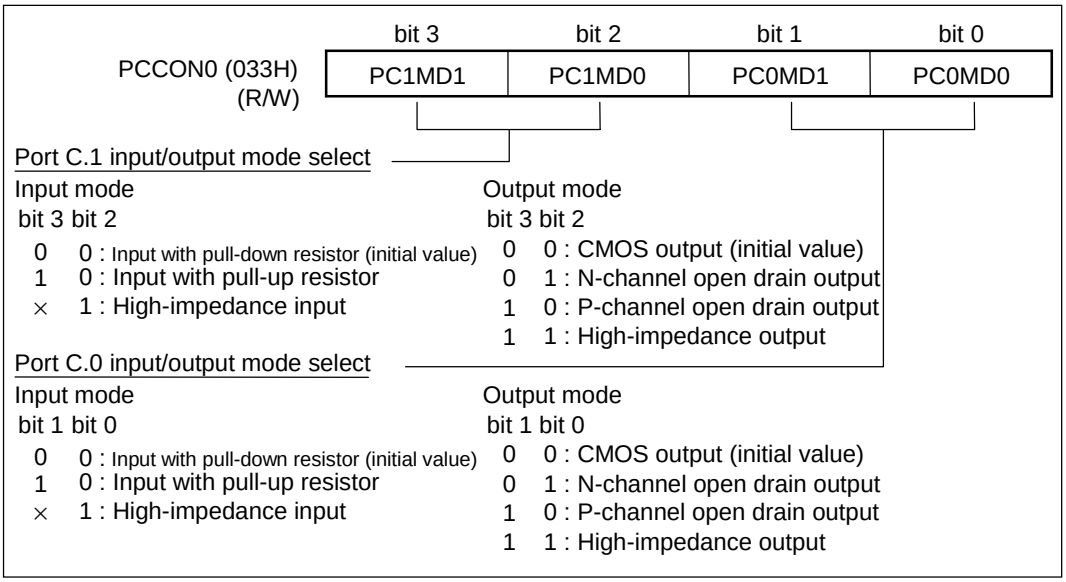
(3) Port C control registers 0/1 (PCCON0, PCCON1)

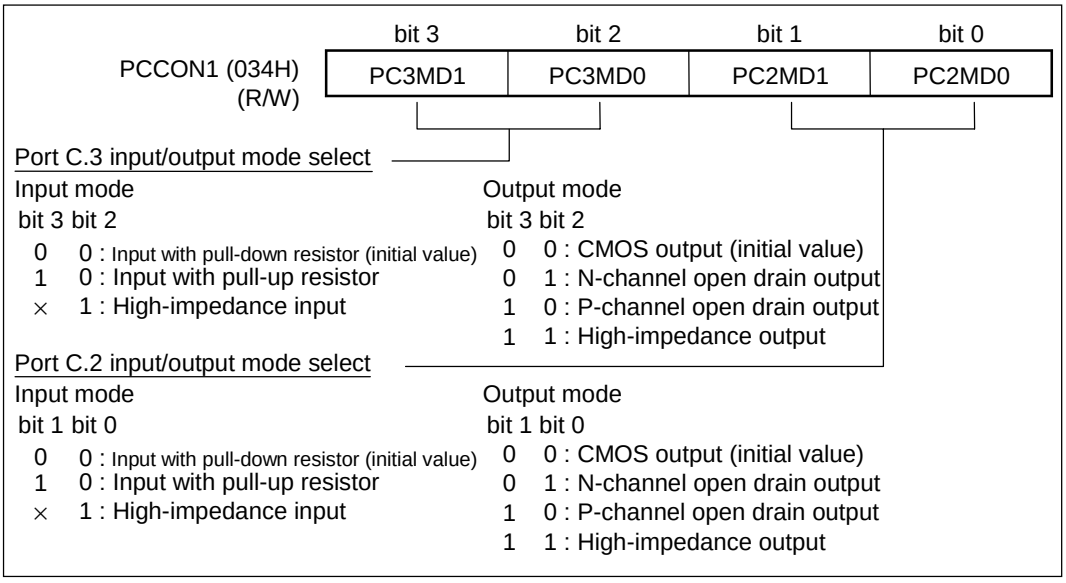
PCCON0 and PCCON1 are 4-bit special function registers (SFRs) used to select port input/output mode.

The input mode can be pull-down resistor input, pull-up resistor input or high-impedance input.

The output mode can be CMOS output, N-channel open drain output, P-channel open drain output or high-impedance output.

At system reset all bits in PCCON0 and PCCON1 are set to "0", and port C is initialized to pull-down resistor input mode and CMOS output mode.





(4) Port C mode registers 0/1 (PCMOD0, PCMOD1)

PCMOD0 and PCMOD1 are 4-bit special function registers (SFRs) used to select the sampling frequency when ports are used for external interrupt, and to select secondary functions other than external interrupt.

The external interrupt sampling frequency is either 128 Hz or 4 kHz.

At system reset all the valid bits in the port C mode registers (PCMOD0, PCMOD1) are initialized to "0".

Port C secondary functions are indicated in Table 10-4.

Table 10-4 Port C Secondary Functions

Port	Secondary function	Description
PC.0	RXD	Serial port receive data input
PC.1	TXC	Serial port transmit clock I/O
PC.2	RXC	Serial port receive clock I/O

0: Input/output port function (initial value)
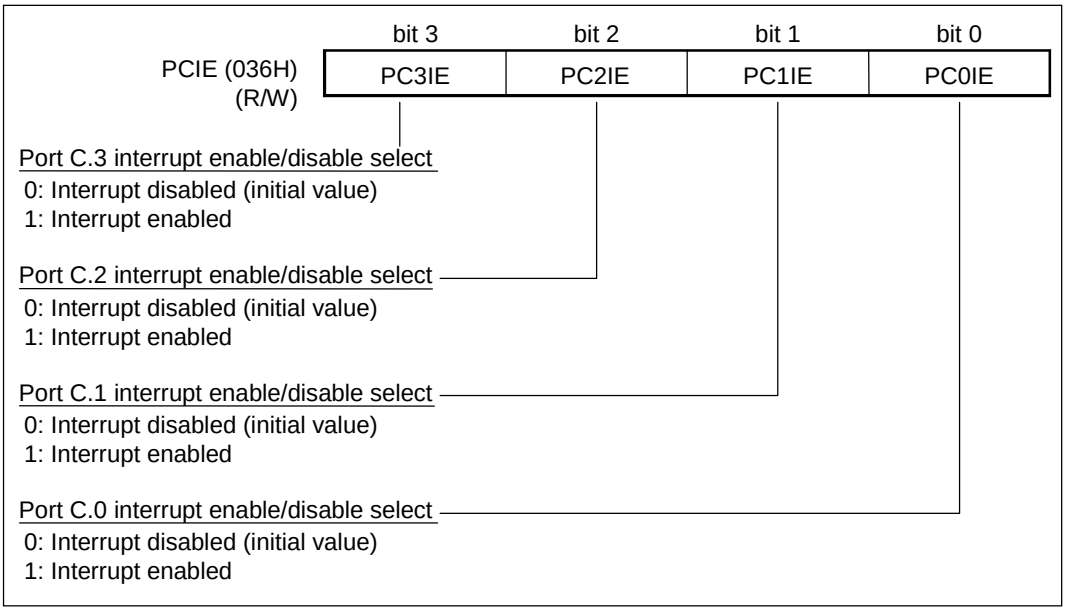
1: Serial port receive data input (RXD) function (goes into input mode irrespective of PC0DIR)

(5) Port C interrupt enable register (PCIE)

PCIE is a 4-bit special function register (SFR) that enables/disables individual bits when port C is used as an external interrupt input.

At system reset, all bits in PCIE are cleared to "0" and port C is initialized to the interrupt disabled state.



10.8.3 Port C External Interrupt Function (External Interrupt 1)

Port C has external interrupt 1 allocated as secondary function. Individual bits can be enabled/disabled for external interrupt 1.

External interrupt generation for port C is triggered by the falling edge of the 128 Hz or 4 kHz time base counter, which is the sampling clock.

After the port level changes, the interrupt request signal (XI1INT) is output, and the interrupt request flag (QXI1) is set. The maximum delay for this sequence is one cycle of the sampling clock (128 Hz or 4 kHz).

Because the port C external interrupt 1 is set by a level change at any of the port C inputs, each bit of the port must be read to determine which bit of port C generated the interrupt.

The interrupt start address for external interrupt 1 is 0016H.

Figure 10-18 shows the equivalent circuit for external interrupt 1 control.

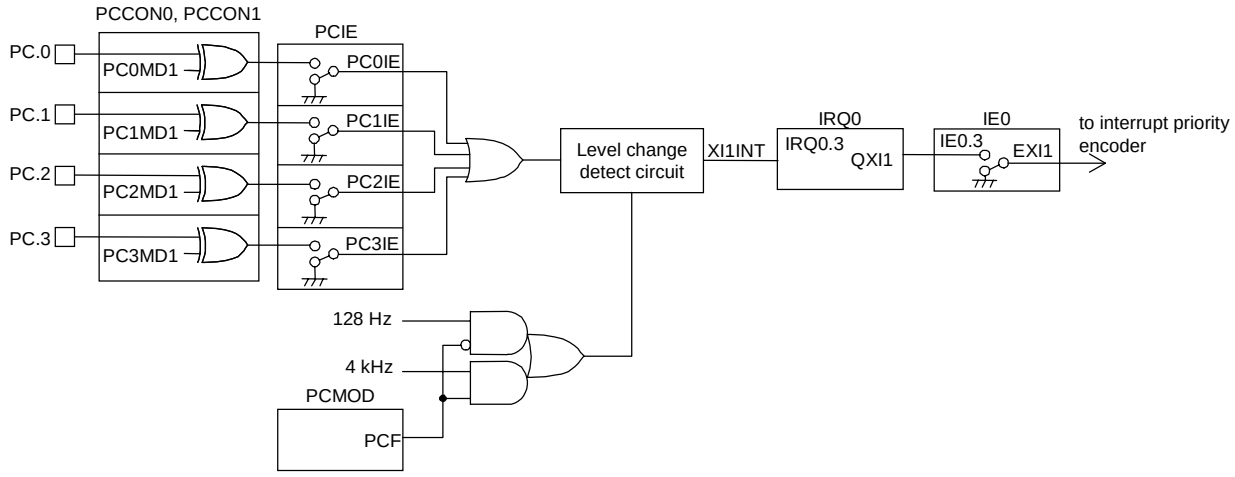


Figure 10-18 External Interrupt 1 Control Equivalent Circuit

Figure 10-19 shows the external interrupt 1 generation timing.

(a) PC0MD1 to PC3MD1 = "0" (initial value: inputs with pull-down resistors or high impedance input) setting

- When all PC.0 to PC.3 inputs are at a "L" level
  External interrupt 1 is generated when any port C input changes to a "H" level.

- When any of PC.0 to PC.3 inputs is at a "H" level
  External interrupt 1 is generated when all the port B inputs change to a "L" level.

(b) PC0MD1 and PC1MD1 = "0" and PC2MD1 and PC3MD1 = "1" (PC.0 and PC.1 selected as inputs with pull-down resistors or high impedance input; PC.2 and PC.3 selected as inputs with pull-up resistors or high impedance input) setting

- When both PC.0 and PC.1 inputs are at a "L" level AND both PC.2 and PC.3 inputs are at a "H" level
  External interrupt 1 is generated when either PC.0 or PC.1 input changes to a "H" level (alternatively, when either PC.2 or PC.3 input changes to a "L" level).

- When either PC.0 or PC.1 input is at a "H" level OR either PC.2 or PC.3 input is at a "L" level External interrupt 1 is generated when both PC.0 and PC.1 inputs change to a "L" level AND both PC.2 and PC.3 inputs change to a "H" level.

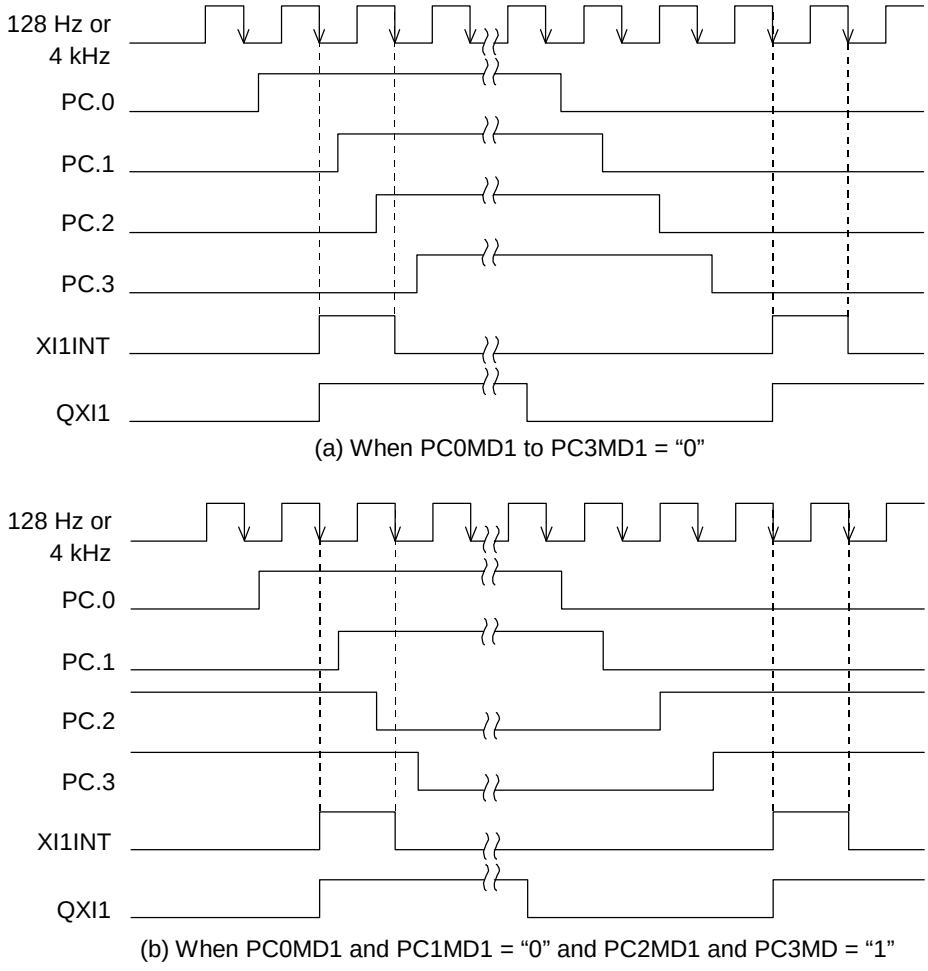

Figure 10-19 Interrupt Generation Timing of External Interrupt 1

10.9 Port E (PE.0–PE.3)

The ML63295A has Port E, a 4-bit input/output port.

10.9.1 Port E Configuration

The circuit configuration for port E is shown in Figure 10-20.

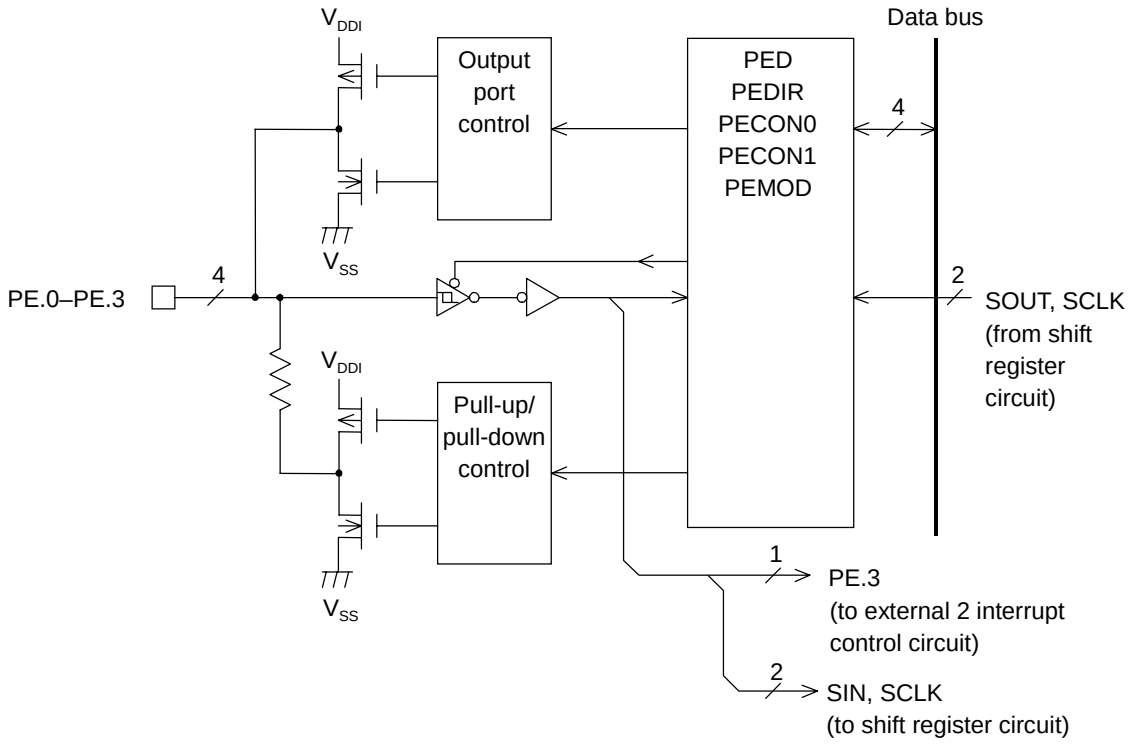

Figure 10-20 Input/Output Port (Port E) Configuration

10.9.2 Port E Registers

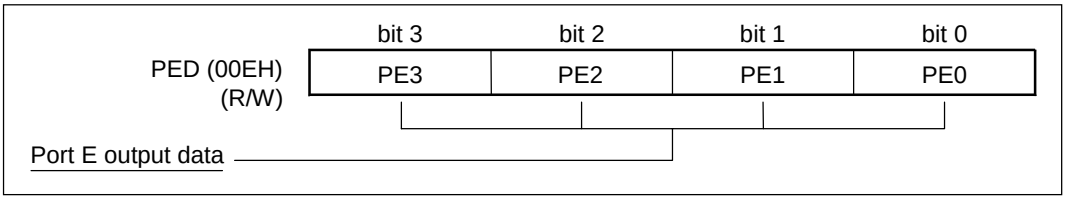
(1) Port E data register (PED)

PED is a 4-bit special function register used to set the output values for port E.

When port E direction register (PEDIR) bits are set to "1" to select the output mode, the content of the port E data register is output to port E.

When the port E data register is read with the output mode selected, the content of the port E data register is read.

When the port E data register is read with PEDIR bits set to "0" (input mode), the pin levels of port E are read.



At system reset all bits in the port E data register (PED) are reset to "0". When data is written to the port E data register, the pin change timing is at the rising edge of the system clock for state 2 of the write instruction.

Figure 10-21 indicates port change timing

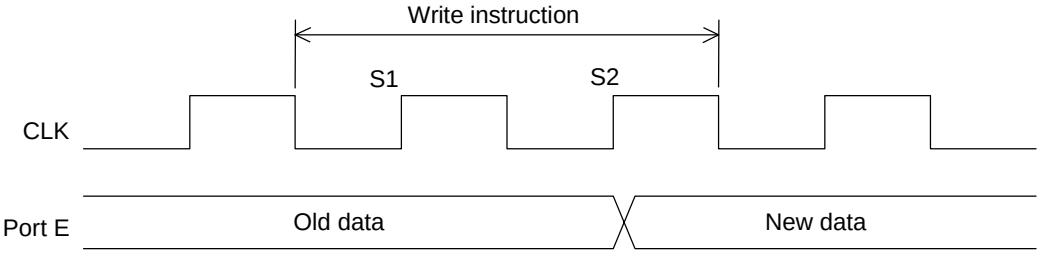


Figure 10-21 Port E Change Timing

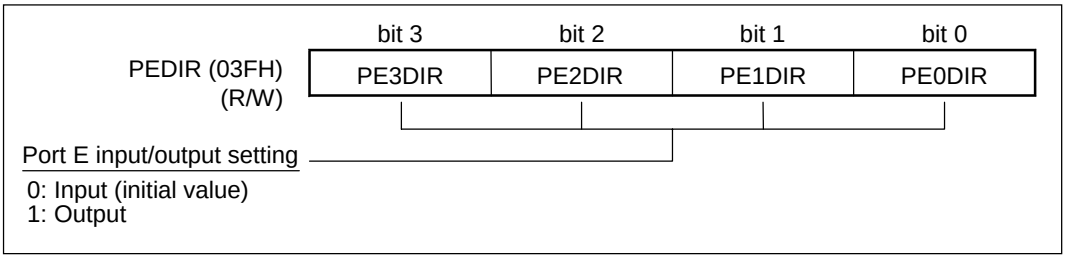
(2) Port E direction register (PEDIR)

PEDIR is a 4-bit special function register (SFR) which specifies the port input/output direction for each bit. Pins corresponding to the PEDIR bits set to "0" are input, and those corresponding to the PEDIR bits set to "1" are output.

At system reset all bits in the port E direction register are set to "0", and port E is initialized to input mode.



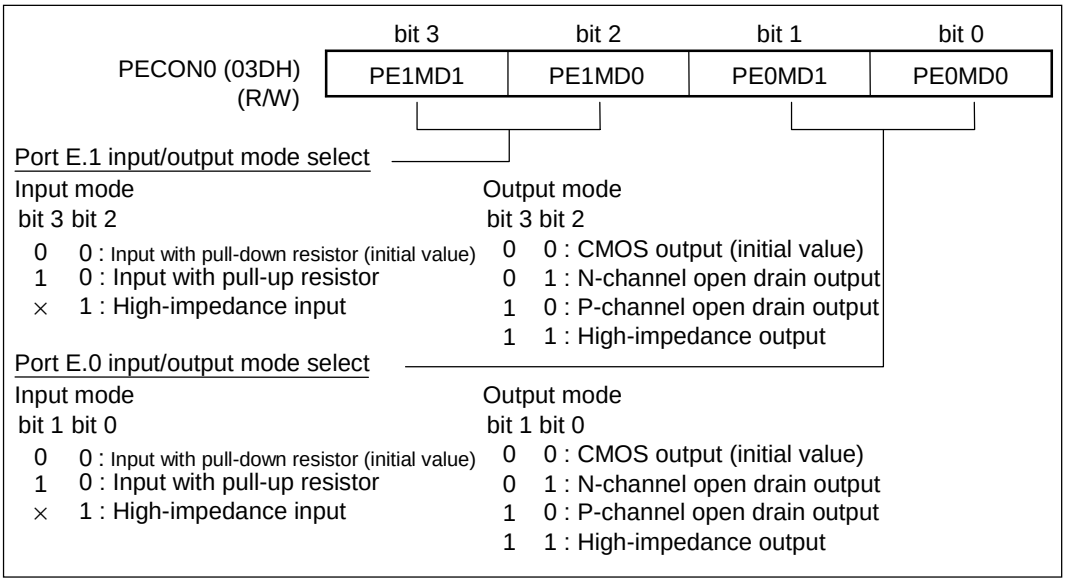
(3) Port E control registers 0/1 (PECON0, PECON1)

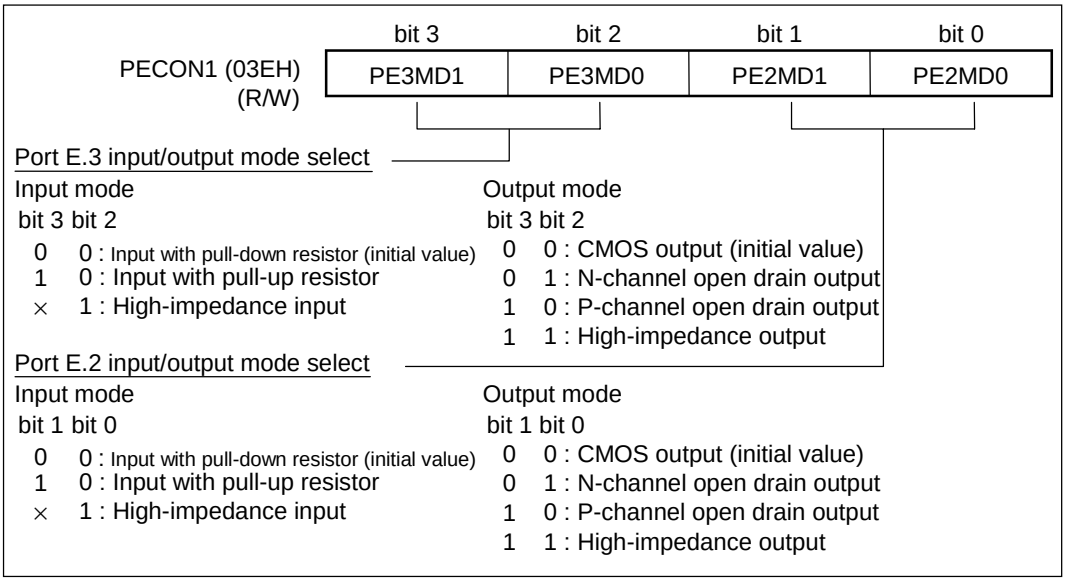
PECON0 and PECON1 are 4-bit special function registers (SFRs) used to select port input/output mode.

The input mode can be pull-down resistor input, pull-up resistor input or high-impedance input.

The output mode can be CMOS output, N-channel open drain output, P-channel open drain output or high-impedance output.

At system reset all bits in PECON0 and PECON1 are set to "0", and port E is initialized to pull-down resistor input mode and CMOS output mode.





(4) Port E mode register (PEMOD)

PEMOD is a 4-bit special function register (SFR) used to select the sampling frequency when PE.3 is used as an external interrupt. It is also used to select port E secondary functions other than external interrupt.

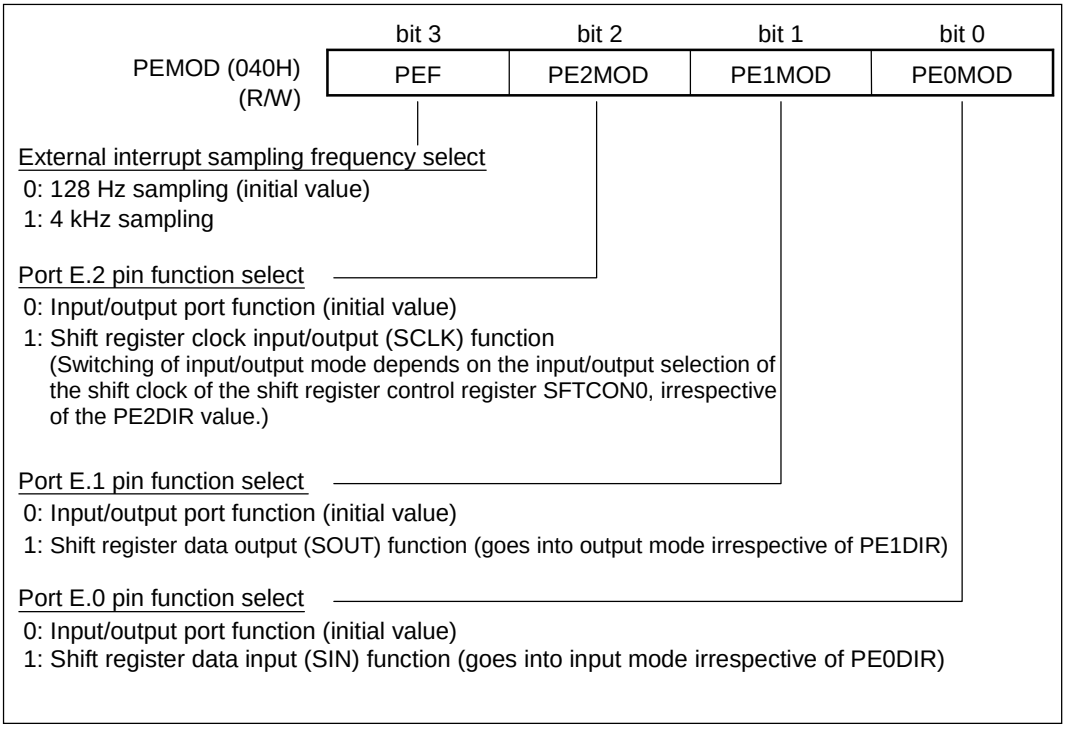
The external interrupt sampling frequency can be selected as either 128 Hz or 4 kHz.

At system reset all bits in PEMOD are initialized to "0".

Port E secondary functions are indicated in Table 10-5.

Table 10-5 Port E Secondary Functions

Port	Secondary function	Description
PE.0	SIN	Shift register data input
PE.1	SOUT	Shift register data output
PE.2	SCLK	Shift register clock I/O
PE.3	INT2	External interrupt 2



10.9.3 Port E.3 External Interrupt Function (External Interrupt 2)

Port E.3 has external interrupt 2 allocated as secondary function.

External interrupt generation for PE.3 is triggered by the falling edge of the 128 Hz or 4 kHz time base counter, which is the sampling clock.

After the port level changes, the interrupt request signal (XI2INT) is output, and the interrupt request flag (QXI2) is set. The maximum delay for this sequence is one cycle of the sampling clock (128 Hz or 4 kHz).

The interrupt start address for external interrupt 2 is 0018H.

Figure 10-22 shows the equivalent circuit for external interrupt 2 control.

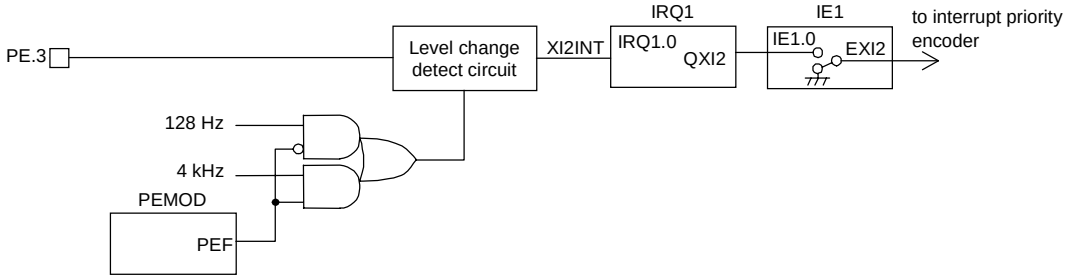


Figure 10-22 External Interrupt 2 Control Equivalent Circuit

Figure 10-23 shows the external interrupt 2 generation timing.

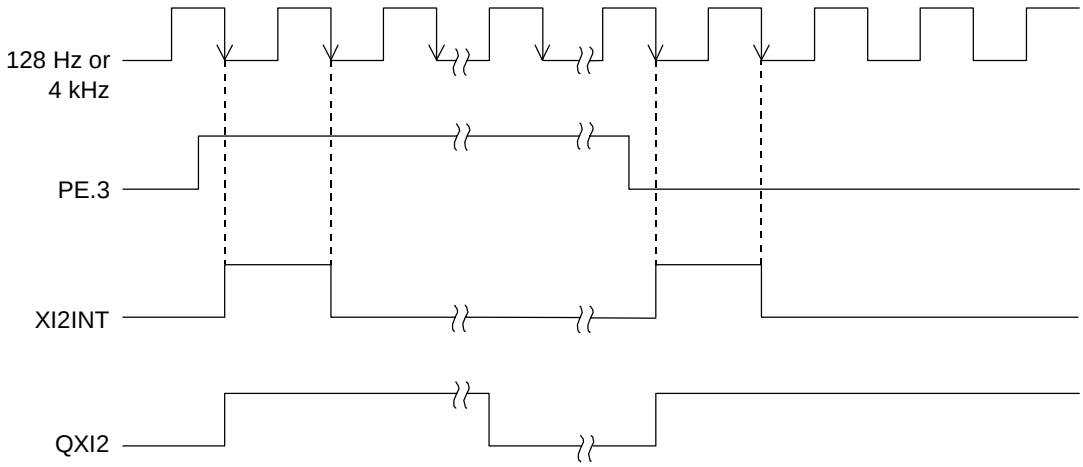

Figure 10-23 External Interrupt 2 Generation Timing

Chapter 11

External Memory Interface (EXTMEM)

11. External Memory Interface (EXTMEM)

11.1 Overview

The ML63295A uses port secondary functions to facilitate the interface with external memory. The external memory transfer instructions are used to transfer data efficiently.

Table 11-1 indicates the port secondary functions for the external memory interface.

Figure 11-1 shows the connection diagram for external memory.

Refer to Chapter 10 for information on port secondary function settings.

Table 11-1 Port Secondary Functions

Pin name	I/O	Function
P4.0/A0	O	P4, P5, P6, P7 secondary functions: Address bus signals for external memory access
P4.1/A1		
P4.2/A2		
P4.3/A3

P8.1/$\overline{WR}$	O	P8.1 secondary functions: Write signal (negative logic) for external memory access

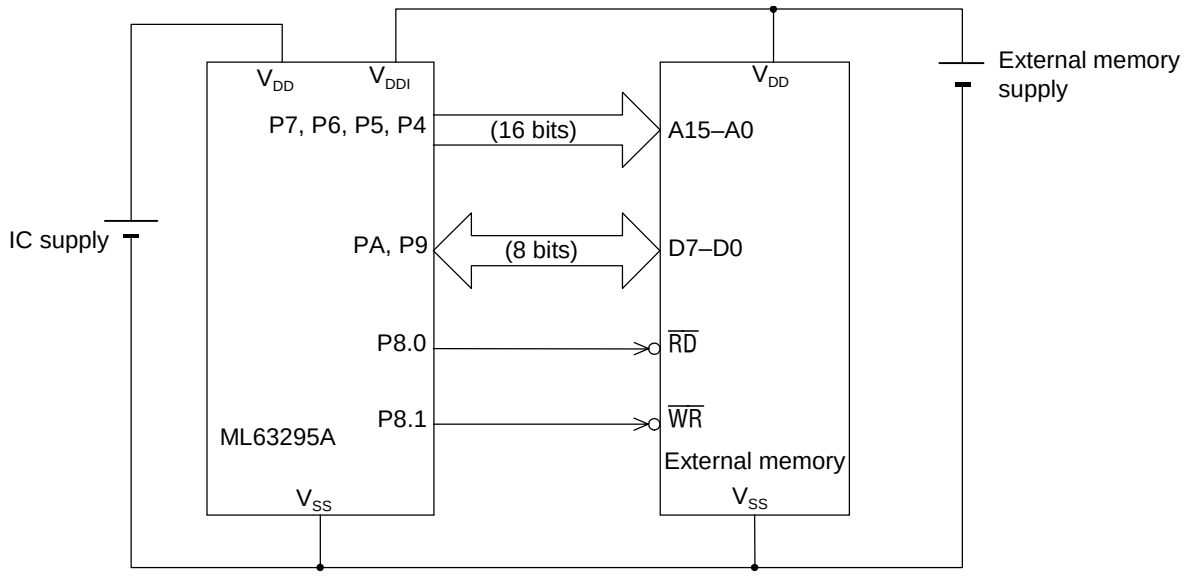

Figure 11-1 Connection to External Memory

11.2 External Memory Address Space

A maximum of 16 address lines can be selected as port secondary functions, allowing access to 64 Kbytes of external memory.

Chip select (CS) can be used for ports other than those set for secondary functions to expand the external memory space above 64 Kbytes. For example (Figure 11-2), if port 3 (P3.3–P3.0) is used for chip select, the external memory space will be

64 Kbytes × 4 = 256 Kbytes.

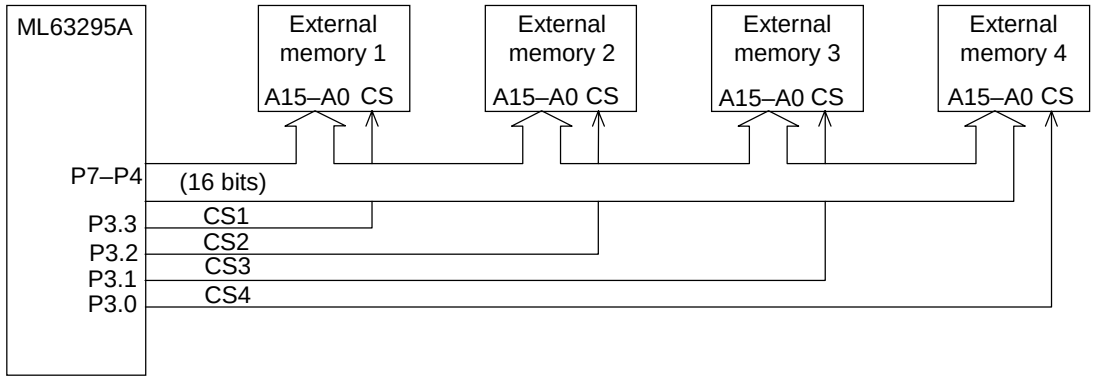

Figure 11-2 Example of Memory Expansion with Chip Select (CS)

11.3 Setting Port Secondary Functions

Port secondary functions are set to access external memory. Refer to Chapter 10 for information on the required registers.

Unless an external memory transfer instruction is executed, P4 to P7, P9 and PA will be as specified in the port control register (that is, normal output and I/O port).

When P8.0 and P8.1 are set for secondary functions they are immediately allocated to read signal ($\overline{RD}$) and write signal ($\overline{WR}$).

11.4 Write to External Memory

The following external memory transfer instructions are executed to write to external memory.

MOVXB [RA],obj
or
MOVXB xadr16,obj

Figure 11-3 shows the timing for external memory write.

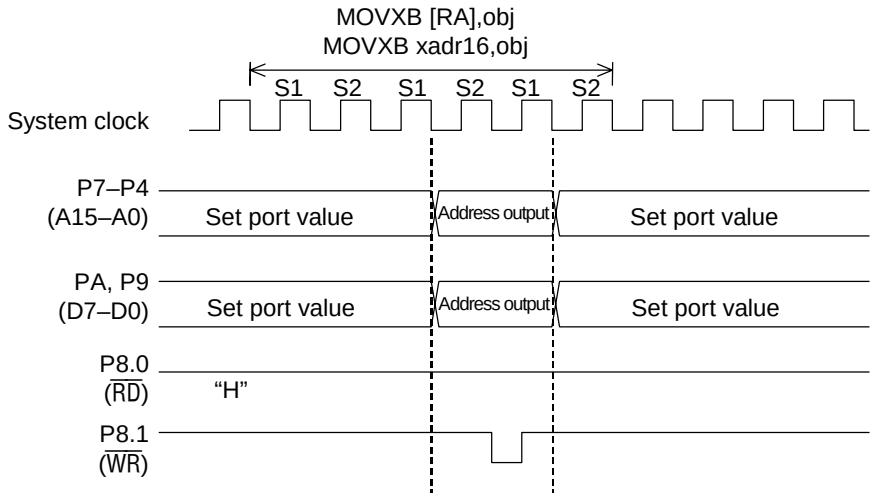

Figure 11-3 Timing for External Memory Write

11.5 Read from External Memory

The following external memory transfer instructions are executed to read from external memory.

MOVXB obj,[RA]
or
MOVXB obj,xadr16

Figure 11-4 shows the timing for external memory read.

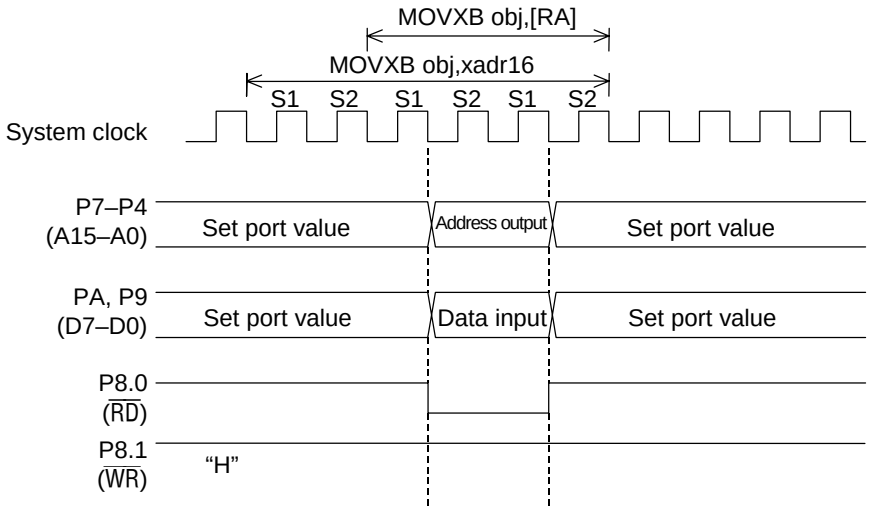

Figure 11-4 External Memory Read Timing

Chapter 12

Melody Driver (MELODY)

12. Melody Driver (MELODY)

12.1 Overview

The ML63295A has an internal melody circuit and buzzer circuit.

While automatically reading melody data in ROM (program memory) as specified by an MSA instruction, the melody circuit outputs a melody signal via the MD and MDB pins.

The melody circuit can select 29 different tones, 63 different tone lengths, and 15 different tempos.

The buzzer circuit has four different buzzer output modes at a frequency of 4 kHz. The buzzer driver signal is output via the MD and MDB pins.

Melody output is a higher priority operation than buzzer output.

12.2 Melody Driver Configuration

The melody driver configuration is shown in Figure 12-1.

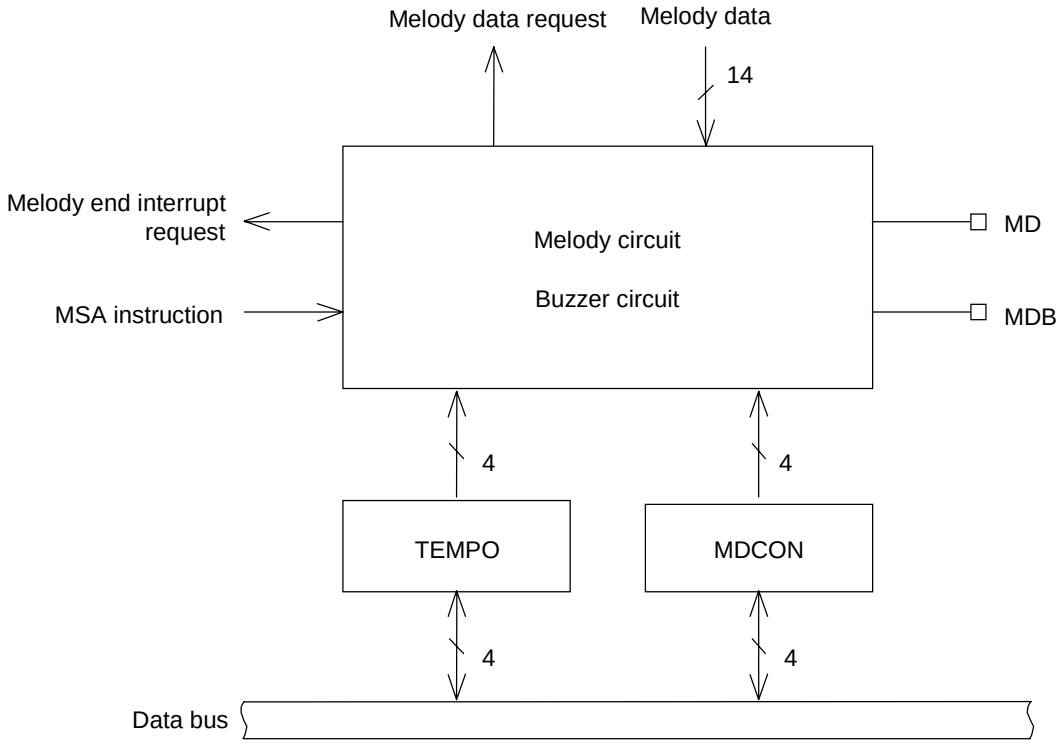

Figure 12-1 Melody Driver Configuration

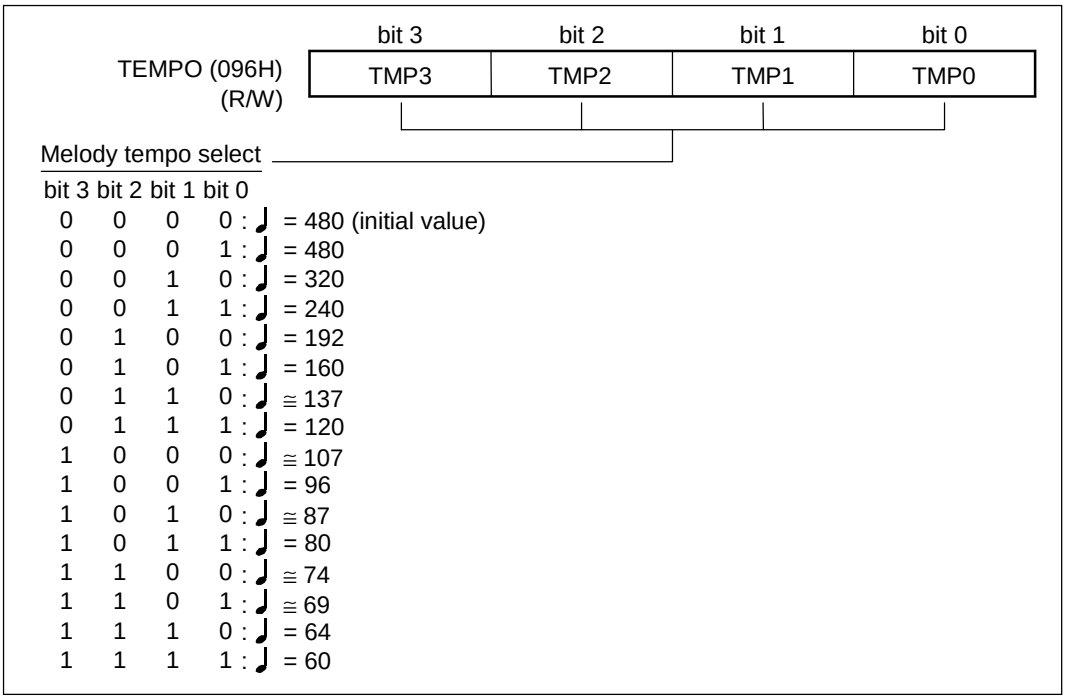
12.3 Melody Driver Registers

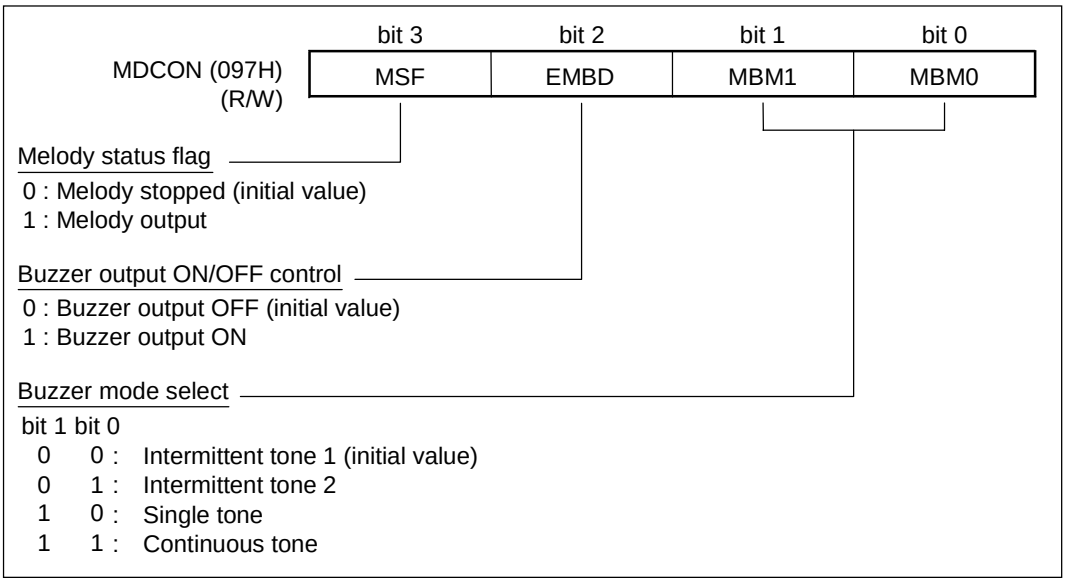
(1) Tempo Register (TEMPO)

TEMPO is a 4-bit special function register (SFR) that sets the tempo of the melody driver.



(2) Melody Driver Control Register (MDCON)

MDCON is a 4-bit special function register (SFR) that controls output of the melody driver.



bit 3: MSF

This flag indicates the melody output status.
When an MSA instruction starts the melody, MSF is set to "1". After output of the last melody data (END bit is "1"), MSF is cleared to "0".
Setting MSF to "0" during melody output will forcibly stop the melody output. If forcibly stopped, the melody output cannot be restarted at the address at which it was stopped.
At system reset, MSF is cleared to "0".

Note:

If MSF (bit 3 of MDCON) is set to "0" to stop melody output forcibly, it is required to set the stop address on the ROM table to the end-data address (8000H). In this case, set MSF to "0" after writing the melody end data that consists of two words of melody (silence with the END bit being "1") data. If this programming is not executed, melody output may not be stopped even if MSF is set to "0". Example programming is shown below.

```
;*Program part**********
      DI                    ; 0. Disable master interrupt (MIE).
      MSA   MDSTOP_DATA     ; 1. Write melody end data to the melody circuit.
      MOV   A, #0           ; 2. Set the MSF to "0".
      MOV   MDCON,A         ;
      MOV   A, #1101b       ; 3. Clear melody end interrupt request (QMD).
      AND   IRQ0, A         ;
      EI                    ; 4. Enable master interrupt (MIE).
;*ROM table data part****
;*Provide two words of melody data so that a melody will always be terminated even if a melody
;*request is issued twice.
MDSTOP_DATA:
      DW    8000H           ; Silence data 1
      DW    8000H           ; Silence data 2
;************************
```

In the EASE63180 Emulator, melody output will be stopped only by setting MSF to "0"; writing melody end data is not needed.

bit 2: EMBD

This bit turns the buzzer output ON or OFF.
At system reset, EMBD is cleared to "0" and buzzer output is turned OFF.
In the single tone output mode, setting EMBD to "1" turns ON the buzzer output. After the second falling edge of the 32 Hz output, EMBD is cleared to "0" and buzzer output is turned OFF.
If melody output is started during buzzer output, EMBD is cleared to "0" and the buzzer output is turned OFF.

bit 1, 0: MBM1, MBM0

These bits select the buzzer output mode.
Output of two types of intermittent tones, a single tone or a continuous tone can be selected.
At system reset, MBM1 and MBM0 are cleared to "0", selecting output of intermittent tone 1.

Buzzer output mode	Waveform
Intermittent tone 1	Intermittent tone waveform synchronized to 8 Hz output of time base counter
Intermittent tone 2	Intermittent tone waveform synchronized to the logical AND of 8 Hz signal output and a "L" level of 1 Hz signal output of the time base counter
Single tone	Single tone waveform beginning when EMBD is set to "1" until second falling edge of 32 Hz output of time base counter
Continuous tone	Continuous tone waveform that is constant while EMBD is "1"

Figure 12-2 shows the output waveforms of the melody driver output pins.

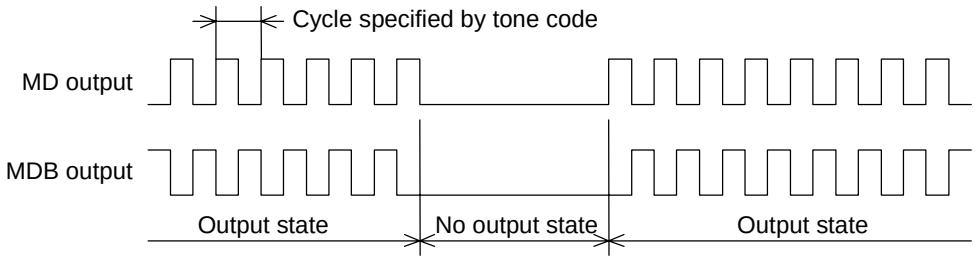


Figure 12-2 Output Waveforms of Melody Driver Output Pins

12.4 Melody Circuit Operation

After the melody tempo is set in the tempo register (TEMP), execution of an MSA instruction will start operation of the melody circuit.

The melody circuit outputs melody data while automatically reading melody data in ROM (program memory) as specified by an MSA instruction. When the last melody data is read (END bit is "1"), the melody circuit generates a melody end interrupt request. At this time, if an MSA instruction is executed, after the last melody data is output, melody output will continue from the melody data specified by the MSA instruction. If an MSA instruction is not executed, the melody output will stop after the last melody data is output.

MSF (bit 3 of MDCON) is a flag indicating the melody output status. When MSF is "1", the melody is being output, and when "0", the melody is stopped. Setting MSF to "0" during melody output will forcibly stop the melody output. If it is required to stop melody output forcibly, describe the program according to the "Note" on page 12-3. If forcibly stopped, the melody output cannot be restarted at the address at which it was stopped.

12.4.1 Tempo Data

Tempo data defines the basic tone length. Tempo data is set in the tempo register (TEMPO).

The tempos (number of counts per minute) set by TEMPO are shown in Table 12-1.

Table 12-1 Melody Tempo

TEMPO					Tempo
TP3–0	TP3	TP2	TP1	TP0	
0H	0	0	0	0	♩ = 480
1H	0	0	0	1	♩ = 480
2H	0	0	1	0	♩ = 320
3H	0	0	1	1	♩ = 240
4H	0	1	0	0	♩ = 192
5H	0	1	0	1	♩ = 160
6H	0	1	1	0	♩ ≅ 137
7H	0	1	1	1	♩ = 120
8H	1	0	0	0	♩ ≅ 107
9H	1	0	0	1	♩ = 96
AH	1	0	1	0	♩ ≅ 87
BH	1	0	1	1	♩ = 80
CH	1	1	0	0	♩ ≅ 74
DH	1	1	0	1	♩ ≅ 69
EH	1	1	1	0	♩ = 64
FH	1	1	1	1	♩ = 60

12.4.2 Melody Data

Melody data is 14-bit format data in the program ROM defining tone, tone length and end tone.

The melody data format is indicated in Figure 12-3.

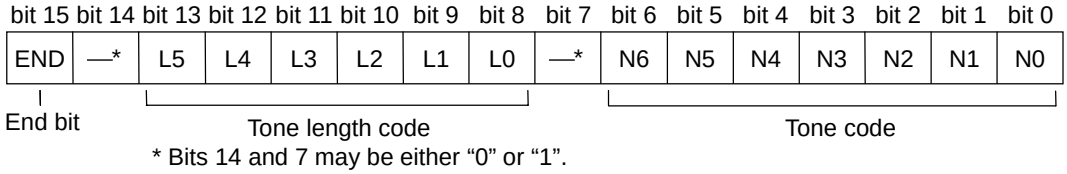

Figure 12-3 Melody Data Format

(1) Tone code

The tone code is set in bits 6 through 0 of the melody data. The frequencies that can be output by the melody circuit are defined as:

$$\frac{65536}{(N + 2)} \text{ Hz (where N is an integer from 4 to 127)}$$

The relation between N and tone code bits is:

$N = 2^6N6 + 2^5N5 + 2^4N4 + 2^3N3 + 2^2N2 + 2^1N1 + 2^0N0$

If N6 through N2 are all set to "0", there is no melody output for the time specified by the tone length code. Values for N1 and N0 are irrelevant.

Table 12-2 indicates the relations between tones and tone codes.

Table 12-2 Tone and Tone Code Correspondence

Tone	Frequency (Hz)	Tone code							
		N6	N5	N4	N3	N2	N1	N0	N6–N0
C^1	529	1	1	1	1	0	1	1	7BH

Fis^3	2979	0	0	1	0	1	0	0	14H

(2) Tone length code

The tone length code is set in melody data bits 13 through 8.

Table 12-3 indicates the relation between tone length and tone length code (L5 to L0).

The tone length that is set during execution of the MSA instruction is shorter by approximately 1 to 3 ms.

When all bits are set to "0", the tone length will be the same as the minimum tone length (the tone length with only L0 set to "1").

Table 12-3 Tone Length and Tone Length Code Correspondence

Tone length	Tone length code						
	L5	L4	L3	L2	L1	L0	L5–L0
	1	1	1	1	1	1	3FH
	1	0	1	1	1	1	2FH
	0	1	1	1	1	1	1FH
	0	1	0	1	1	1	17H
	0	0	1	1	1	1	0FH
	0	0	1	0	1	1	0BH
	0	0	0	1	1	1	07H
	0	0	0	1	0	1	05H
	0	0	0	0	1	1	03H
	0	0	0	0	1	0	02H
	0	0	0	0	0	1	01H

Tone lengths specified by the tone length code and the tempo data are expressed by the following:

$1.953125 \times (TP + 1) \times (L + 1)$ ms (where TP is an integer from 1 to 15, and L is an integer from 1 to 63)

TP is a value set in the tempo register (TEMPO), and has the following bit correspondence:

$TP = 2^3TP3 + 2^2TP2 + 2^1TP1 + 2^0TP0$

L is set by the tone length code, and has a bit correspondence with the tone length code as:

$L = 2^5L5 + 2^4L4 + 2^3L3 + 2^2L2 + 2^1L1 + 2^0L0$

(3) END bit

The END bit is set in bit 15 of the melody data. When the output of the last melody data is started (END bit is "1"), the melody circuit generates a melody end interrupt request, and stops the melody after the last melody data is output.

12.4.3 Melody Circuit Application Example

An example melody is shown in Figure 12-4.

Table 12-4 lists the note codes for the melody shown in Figure 12-4.

Figure 12-4 Example Melody

Table 12-4 Note Code Table

Note	Note code																Hex
	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	
	END	—*	L5	L4	L3	L2	L1	L0	—*	N6	N5	N4	N3	N2	N1	N0	
G^2	0	0	1	0	1	1	1	1	0	0	1	0	1	0	0	0	2F28H

* Bits 14 and 7 may be "0" or "1", but in this example they are shown as "0".

12.5 Buzzer Circuit Operation

When EMBD (bit 2 of MDCON) is set to "1", a buzzer driver signal is sent to the melody driver output pins (MD, MDB).

Four buzzer output modes can be selected by MBM1 (bit 1 of MDCON) and MBM0 (bit 0 of MDCON): two types of intermittent tones, a single tone, or a continuous tone output. The buzzer output frequency is 4 kHz and has a 50% duty ratio.

In the intermittent tone 1 mode, a waveform synchronized to the 8 Hz output of the time base counter is output.

In the intermittent tone 2 mode, a waveform synchronized to the logical AND of 8 Hz signal output and a "L" level of 1 Hz signal of the time base counter is output.

In the single tone mode, output starts in synchronization with the rising edge of EMBD. At the second falling edge of the 32 Hz output of the time base counter, EMBD is cleared to "0" and output is stopped.

In the continuous tone mode, output is continued while EMBD is "1".

While the melody is being output (MSF (bit 3 of MDCON) = "1"), the buzzer output is turned OFF. If melody output is started during buzzer output, EMBD is cleared to "0", the buzzer output is stopped, and melody output is given priority.

Figure 12-5 shows the output waveforms of each mode. Shaded sections indicate the 4 kHz output frequency.

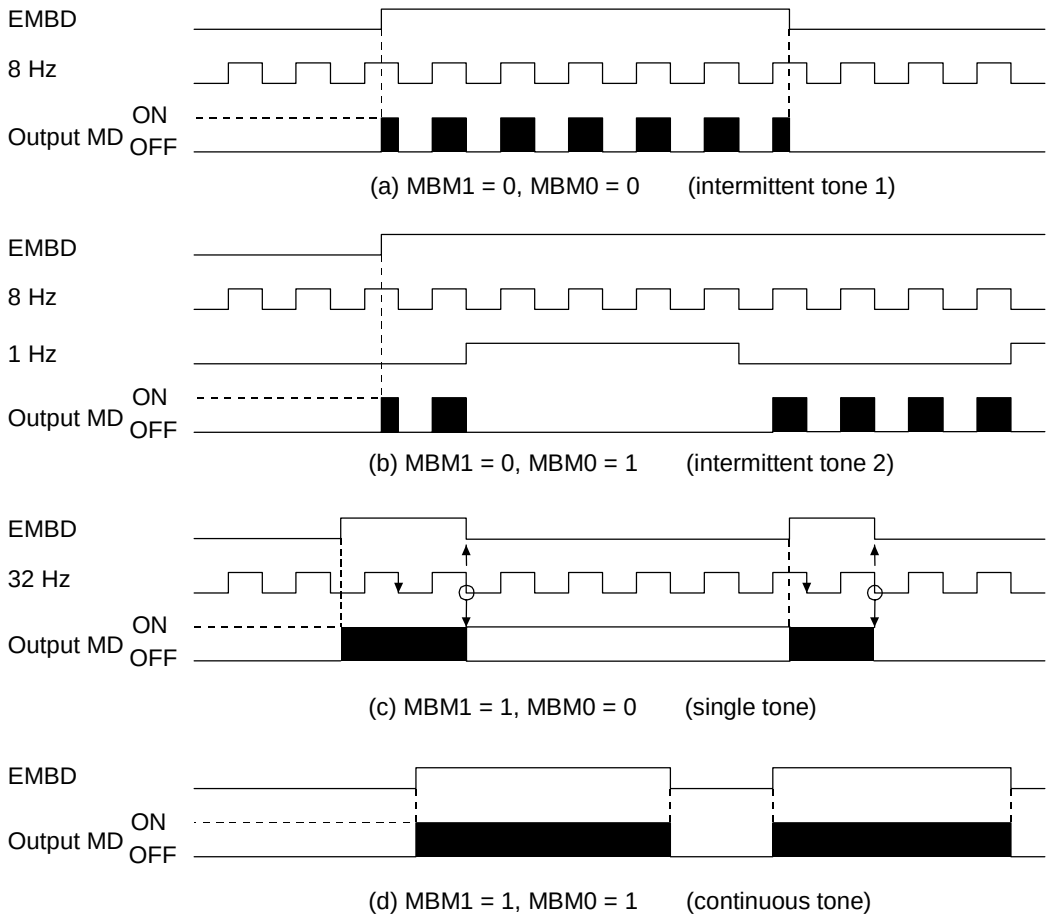

Figure 12-5 Buzzer Driver Output Waveforms in Each Output Mode

Chapter 13

Serial Port (SIO)

13. Serial Port (SIO)

13.1 Overview

The ML63295A has a built-in serial communication port (serial port) that can be selected for either synchronous or asynchronous communication.

The serial port implements the send and receive circuits in independent circuits, making it possible to send and receive simultaneously.

The send and receive modes can be UART mode (asynchronous communication mode) or synchronous mode (synchronous communication mode).

In synchronous mode an internal clock mode generates the shift clock internally, and an external clock mode receives an external shift clock.

Table 13-1 shows the serial port modes.

Table 13-1 Serial Port Modes

		Mode		Baud rate
Serial port	Send side	UART mode		Can be set to a user-specified value with timers 2, 3 (TM2, 3)
		Synchronous mode	Internal clock mode	Low-speed clock (30 to 80 kHz)
			External clock mode	From external clock
	Receive side	UART mode		• 2 TBCCLK (9600 bps) • TBCCLK (4800 bps) • 1/2 TBCCLK (2400 bps) • 1/4 TBCCLK (1200 bps)
		Synchronous mode	Internal clock mode	Low-speed clock (30 to 80 kHz)
			External clock mode	From external clock

13.2 Serial Port Configuration

Figure 13-1 indicates the serial port configuration.

The serial port consists of the send/receive clock generator circuits, the send/receive control registers, the buffer registers to store send/receive data, send/receive data transfer shift registers, and the send/receive status registers.

PC.0/RXD is the send serial data input pin, PC.3/TXD is the send serial data output pin, PC.1/TXC is the serial send clock I/O pin, and PC.2/RXC is the serial receive clock I/O pin. Set I/O and secondary functions with the port control registers as needed for each communication mode.

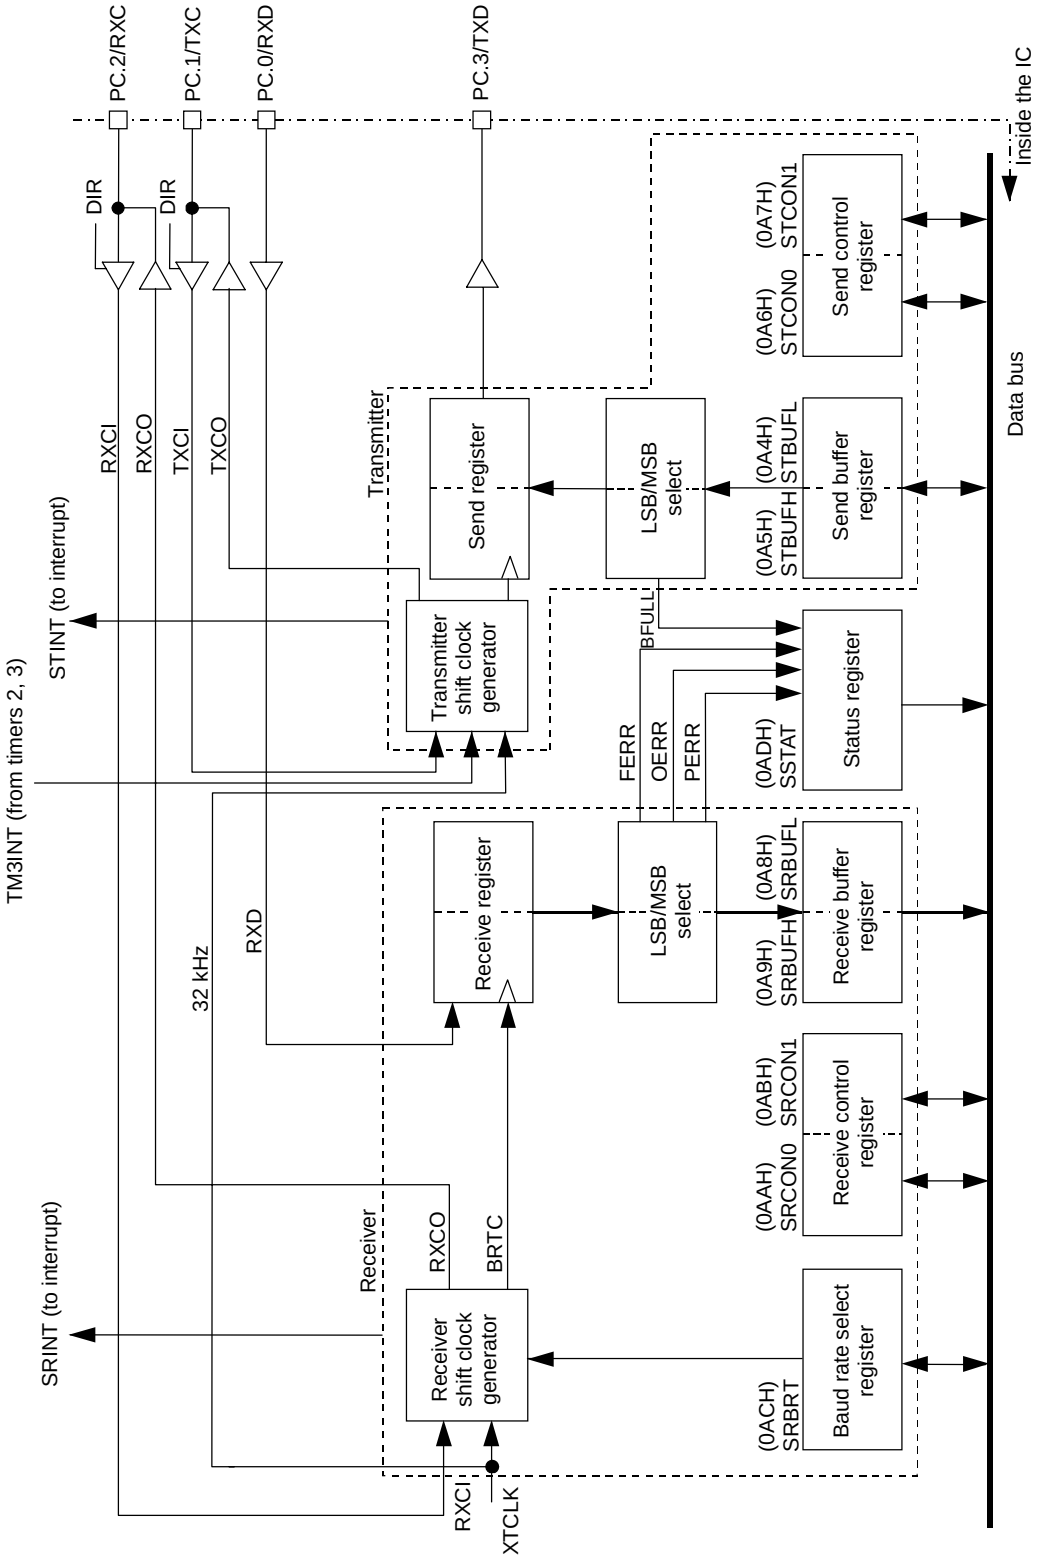

Figure 13-1 Serial Port Configuration

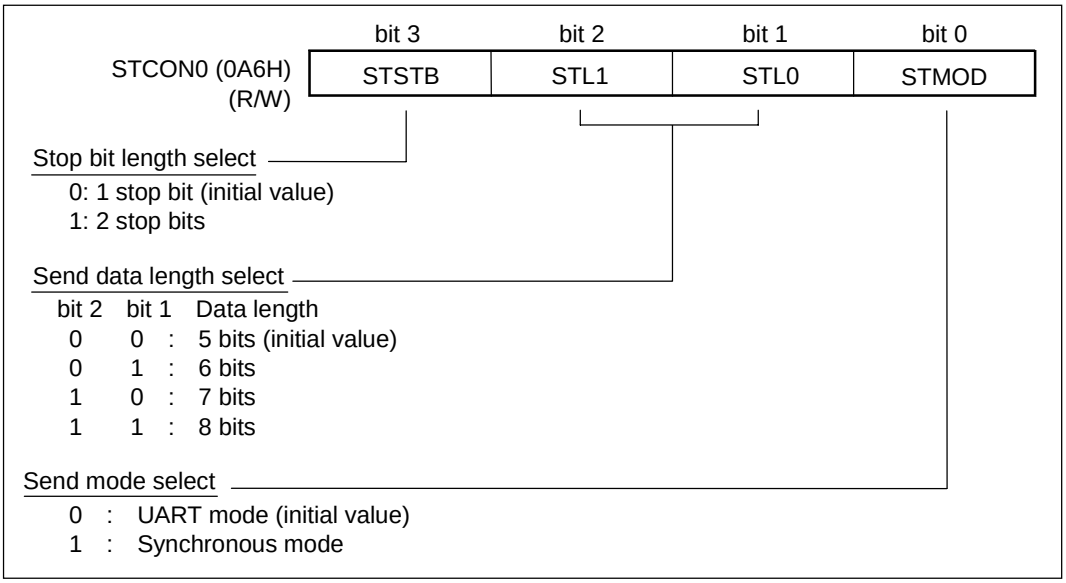
13.3 Serial Port Registers

(1) Send control registers 0/1 (STCON0, STCON1)

STCON0 and STCON1 are 4-bit special function registers (SFRs) to control the serial port send operation. STCON0 and STCON1 are initialized to "0" at system reset.



bit 3: STSTB (Serial Transmission STop Bit)

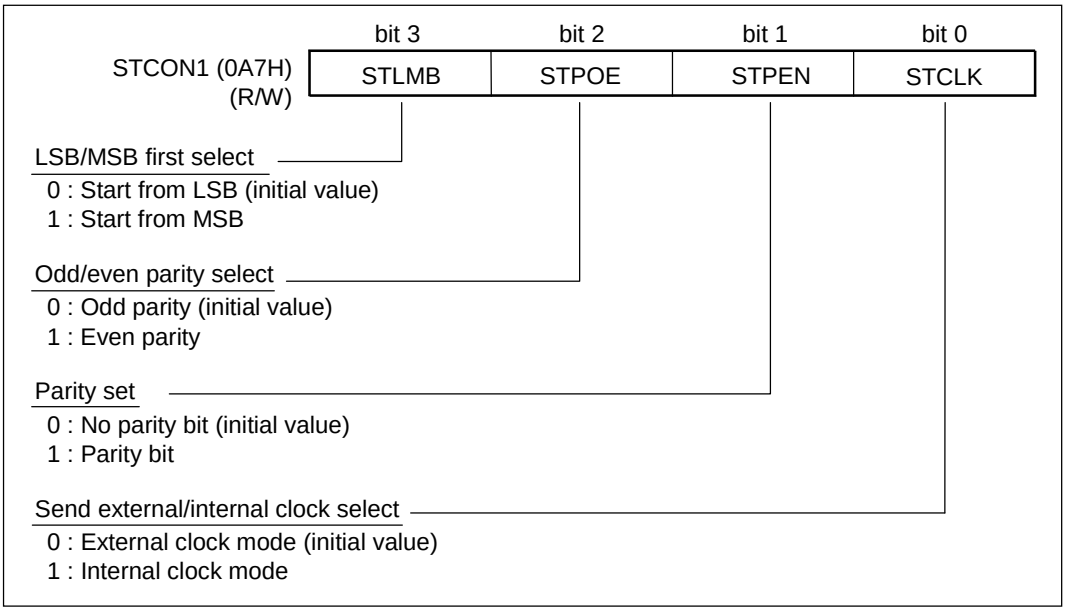
This bit specifies stop bit length. Valid only when bit 0 is "0" (UART mode).

bit 2, 1: STL1 (Serial Transmission Length select bit 1),
STL0 (Serial Transmission Length select bit 0)

These bits specify the send data length.

bit 0: STMOD (Serial Transmission MODe bit)

This bit specifies the serial port send operation mode.



bit 3: STLMB (Serial Transmission Least significant bit first or Most significant Bit first)

This bit specifies either LSB first or MSB first for send data.

bit 2: STPOE (Serial Transmission Parity Odd or Even number bit)

This bit specifies whether the parity bit is even or odd. Valid only when bit 1 is "1" (parity bit).

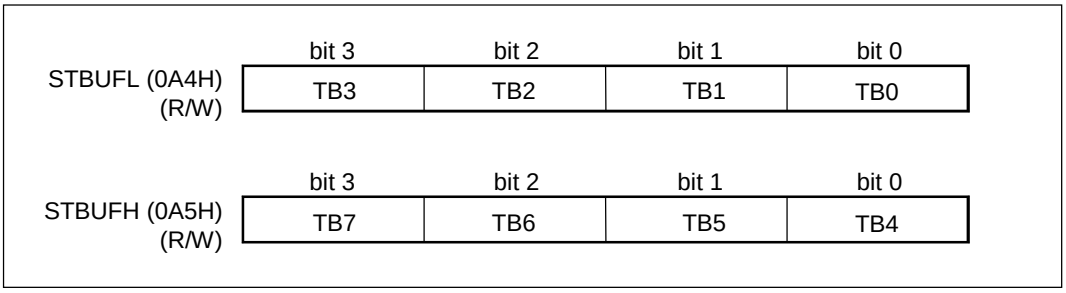
bit 1: STPEN (Serial Transmission Parity ENable bit)

This bit specifies whether or not a parity bit is added.

bit 0: STCLK (Serial Transmission CLock select bit)

This bit specifies the external/internal send clock for synchronous mode. Valid only when STMOD (bit 0 of STCON0) is "1" (synchronous mode).

(2) Send buffer registers (STBUFL, STBUFH)



STBUFL and STBUFH are 4-bit special function registers (SFRs) that set send data for serial port send operation.

LSB/MSB selection (described later) allows the data send direction (LSB or MSB first) to be specified. Both STBUFL and STBUFH are initialized to "0" at system reset.

Send operation begins when send data is set to STBUFH. Be sure to set send data to STBUFL before setting data to STBUFH.

Also set the baud rate and send mode before beginning send operation.

If send operation is already under way when send data is set to STBUFH, send for the new data begins when the prior send has ended, and at the same time an interrupt request signal (STINT) is generated. In the STINT interrupt routine the program should first write the send data to STBUFL and STBUFH to assure no pauses in the send sequence.

(3) Send register

The send register is a shift register that handles the shift operation in send. At system reset it is cleared to 00H. The send register cannot be directly accessed from the CPU.

The hardware send flow is indicated in Figure 13-2, to explain the timing for transfer of data from STBUFL/H to the send register.

First set the send mode and baud rate. When send data is set to STBUFH, the status (SSTAT) buffer full flag (BFULL) is set to "1", and unless send operation is already under way the content of STBUFL/H is transferred to the send register and send operation begins. When send operation begins the BFULL flag is reset to "0", and the next send data can be set to STBUFL/H.

If prior data send operation is not complete, the send data is held in STBUFL/H until send is completed. In this case BFULL remains set to "1". When the prior send operation is complete the send data will be transferred from STBUFL/H to the send register, and send begins.

Note:

When BFULL is "1" it is possible to set data to STBUFL/H, but prior data set to STBUFL/H that is being held there is overwritten and lost. Always set data after verifying that the BFULL flag is "0".

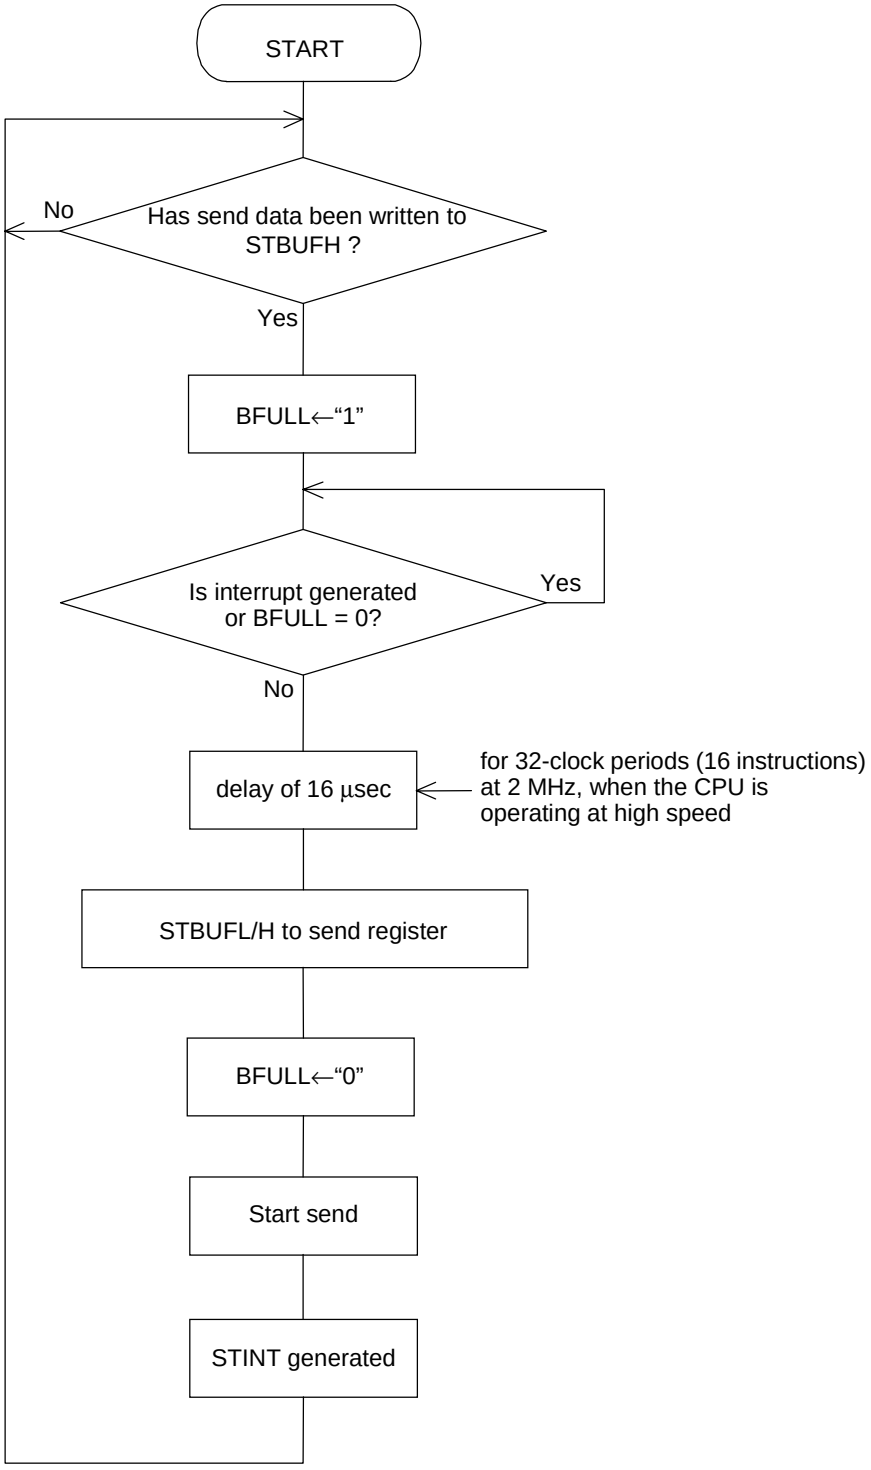


Figure 13-2 Hardware Send Operation Flow

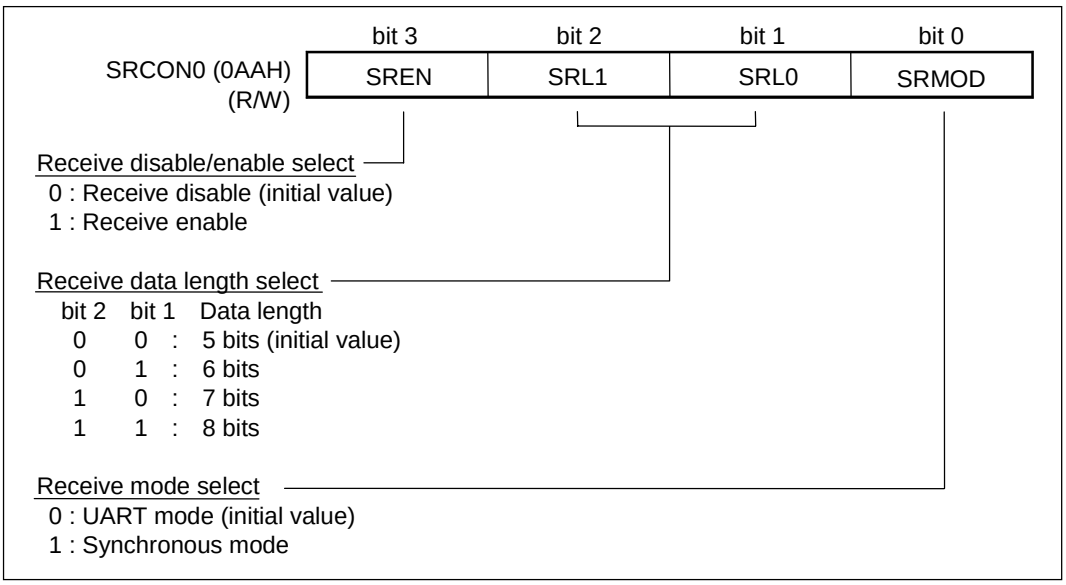
(4) Receive control registers 0/1 (SRCON0, SRCON1)

SRCON0 and SRCON1 are 4-bit special function registers (SFRs) controlling serial port receive operation.

SRCON0 and SRCON1 are initialized to "0" at system reset.



bit 3: SREN (Serial Reception ENable bit)

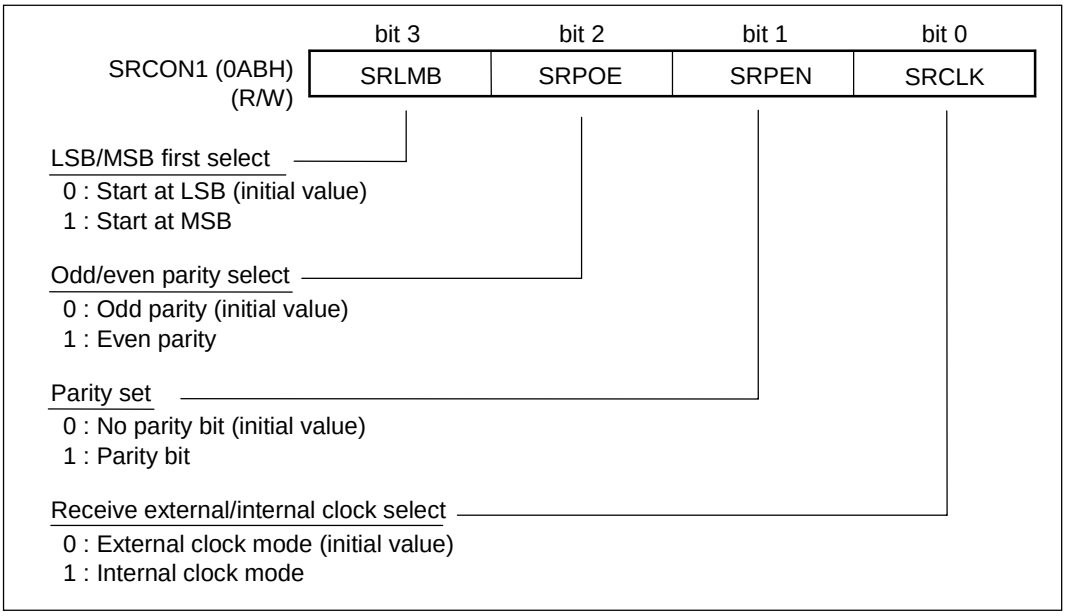
This bit specifies receive operation disable/enable. After receive is enabled in the synchronous mode, this bit is reset to "0" after receiving one frame of data. In the UART mode it does not change.

bit 2, 1: SRL1 (Serial Reception Length select bit 1),
SRL0 (Serial Reception Length select bit 0)

These bits specify the receive data length.

bit 0: SRMOD (Serial Reception MODe bit)

This bit specifies the serial port receive operation mode.



bit 3: SRLMB (Serial Reception Least significant bit first or Most significant Bit first)

This bit specifies either LSB first or MSB first for receive data.

bit 2: SRPOE (Serial Reception Parity Odd or Even number bit)

This bit specifies whether the parity bit is even or odd. Valid only when bit 1 is "1" (parity bit).

bit 1: SRPEN (Serial Reception Parity ENable bit)

This bit specifies whether or not a parity bit is added.

bit 0: SRCLK (Serial Reception CLocK select bit)

This bit specifies the external/internal receive clock for synchronous mode. Valid only when SRMOD (bit 0 of SRCON0) is "1" (synchronous mode).

(5) Receive register

The receive register is the shift register that handles shift operation at receive. It is initialized to 00H at system reset. It cannot be directly accessed by the CPU. When a receive operation is complete, the data read into the receive register is transferred to SRBUFL/H, and at the same time the receive interrupt request signal (SRINT) is generated.

(6) Receive buffer registers (SRBUFL, SRBUFH)

	bit 3	bit 2	bit 1	bit 0
SRBUFL (0A8H) (R)	RB3	RB2	RB1	RB0
SRBUFH (0A9H) (R)	RB7	RB6	RB5	RB4

SRBUFL and SRBUFH are 4-bit special function registers (SFRs) used to hold the received data in serial port reception. SRBUFL and SRBUFH are initialized to "0" at system reset.

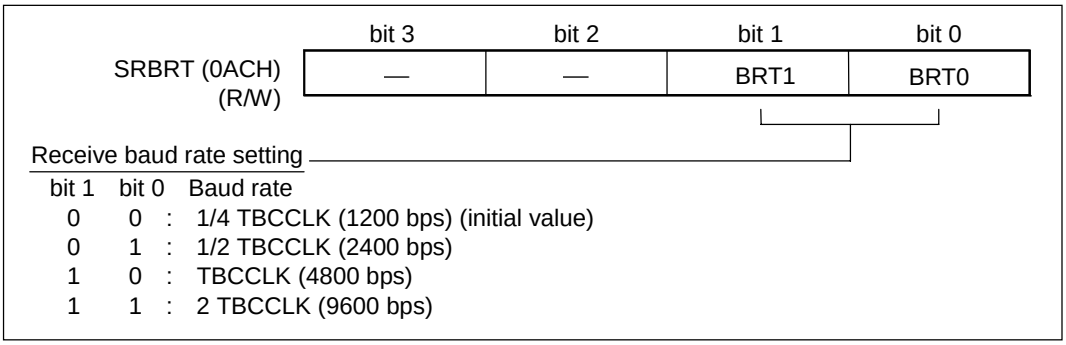
When receive operation is completed the contents of the receive register are sent to SRBUFL/H, and the receive interrupt request (SRINT) is generated. The contents of SRBUFL/H are held until the next receive operation is completed.

If data from a prior receive operation is in SRBUFL/H and new data is received, an overrun error will result. When an overrun error is generated, new received data cannot be loaded into SRBUFL/H.

(7) Receive baud rate setting register (SRBRT)

SRBRT is a 4-bit special function register (SFR) used to set the receive baud rate for serial port receive operation in UART mode.

SRBRT is initialized to 0CH at system reset.



bit 1, 0: BRT1 (Baud RaTe select bit 1), BRT0 (Baud RaTe select bit 0)

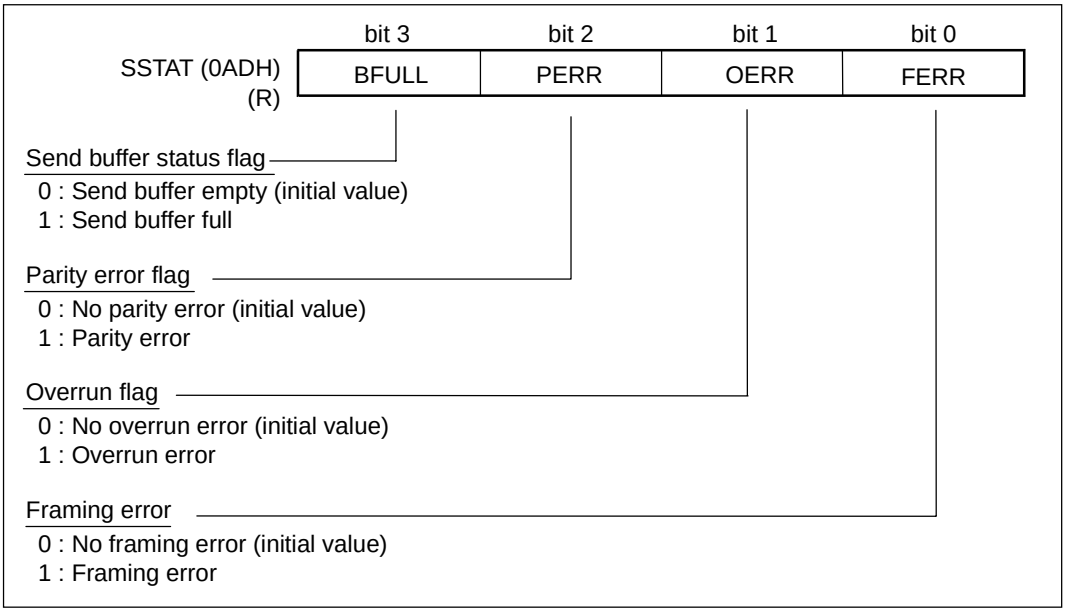
These bits set the receive baud rate.

(8) Serial port status register (SSTAT)

SSTAT is a 4-bit special function register (SFR) used to indicate the status of serial port send/receive.

SSTAT is initialized to "0" at system reset.

SSTAT is a read-only register, and the content is reset every time it is read.



bit 3: BFULL (send Buffer FULL flag)

This bit is enabled in both UART and synchronous modes, and is set to "1" when send data is set to STBUFL/H in the send mode, and reset to "0" when the send data is transferred to the send register.
When BFULL is set to "1" and send data is set (written) to STBUFL/H, the previous data set to those registers is overwritten and lost. Always set data only after verifying that the BFULL flag is "0".

bit 2: PERR (Parity ERRor flag)

This bit is enabled in both UART and synchronous modes, and is set to "1" when the parity for the received data does not match the parity bit attached to the data.

bit 1: OERR (Overrun ERRor flag)

This bit is enabled in both UART and synchronous modes, and is set to "1" when data reception is completed and the data received the previous time has still not been transferred to the CPU. In this case, the new data cannot be transferred to SRBUFL/H.

bit 0: FERR (Framing ERRor flag)

This is only enabled in the UART mode and is set to "1" in the following instances.

(1) when a "1" is detected in start bit sampling
(2) when a "0" is detected in stop bit sampling

In either case a receive interrupt request signal (SRINT) is generated.

13.4 Serial Port Operation Description

13.4.1 Data Format

(1) UART mode

The data format for the UART mode is shown in Figure 13-3.

SRCON0/1 and STCON0/1 can be set to specify a data bit length of 5 to 8 bits. The parity bit can be enabled/disabled. If enabled it can be set to even or odd. Stop bit length can be set to 1 or 2 bits.

The combination of these parameters gives a range of from 7 to 12 bits for send/receive data frames.

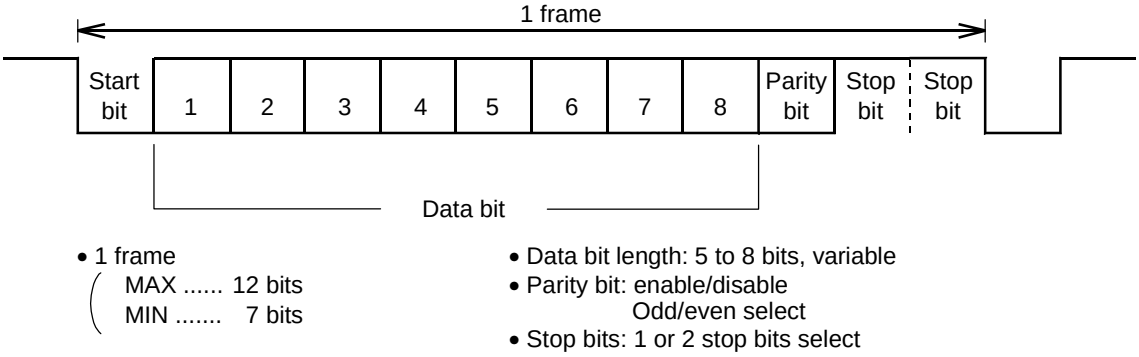


Figure 13-3 UART Mode Data Format

(2) Synchronous mode

The data format for the UART mode is shown in Figure 13-4.

SRCON0/1 and STCON0/1 can be set to specify a data bit length of 5 to 8 bits. The parity bit can be enabled/disabled, and if enabled can be set to even or odd.

The combination of these parameters gives a range of from 5 to 9 bits for send/receive data frames.

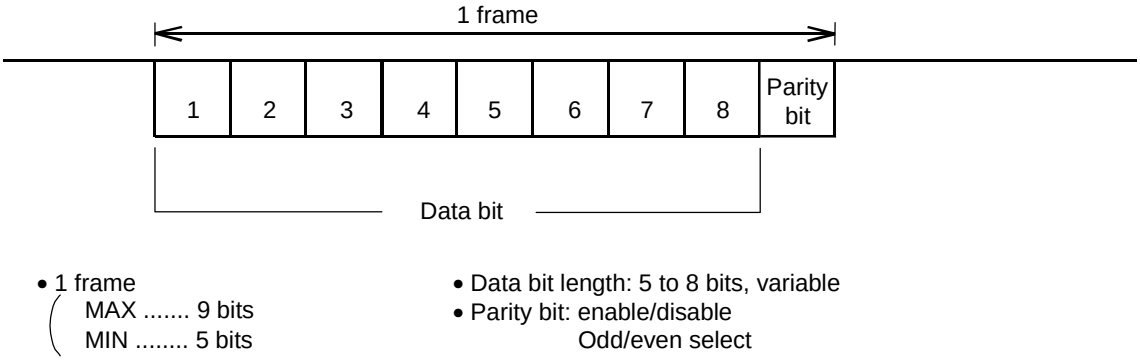

Figure 13-4 Synchronous Mode Data Format

13.4.2 Send Operation Description

The serial port send circuit has a two-stage configuration. This consists of the send register and the send buffer register (STBUFL/H), so it is possible to set send data to STBUFL/H while sending the previous data. When the BFULL flag of the serial port status register (SSTAT) is 1, however, it indicates that STBUFL/H send data has not yet been transferred to the send register. Always verify that the BFULL flag is 0 before transferring data.

(1) UART mode

The UART mode is specified by setting STMOD (bit 0 of STCON0) to "0". Figure 13-5 is the UART mode send timing chart. The UART mode send procedure is described below. The send baud rate is set first, then the timer, and then the send format (data bit length, parity bit, etc.) in STCON0 and STCON1. The TM3INT signal supplied from timers 2 and 3 is the baud rate clock.

① Set send data to STBUFL/H.

② The send data is transferred from STBUFL/H to the send register, and send operation begins. At the same time the serial port send interrupt request (STINT) is generated.

③ Verify that BFULL = "0", then after a delay of 16 μsec, set the next send data to STBUFL/H.

④ When send operation is complete, the send data set to STBUFL/H is transferred to the send register, and send operation begins. At the same time the serial port send interrupt request (STINT) is generated.

Repeat operation ③ the required number of times.

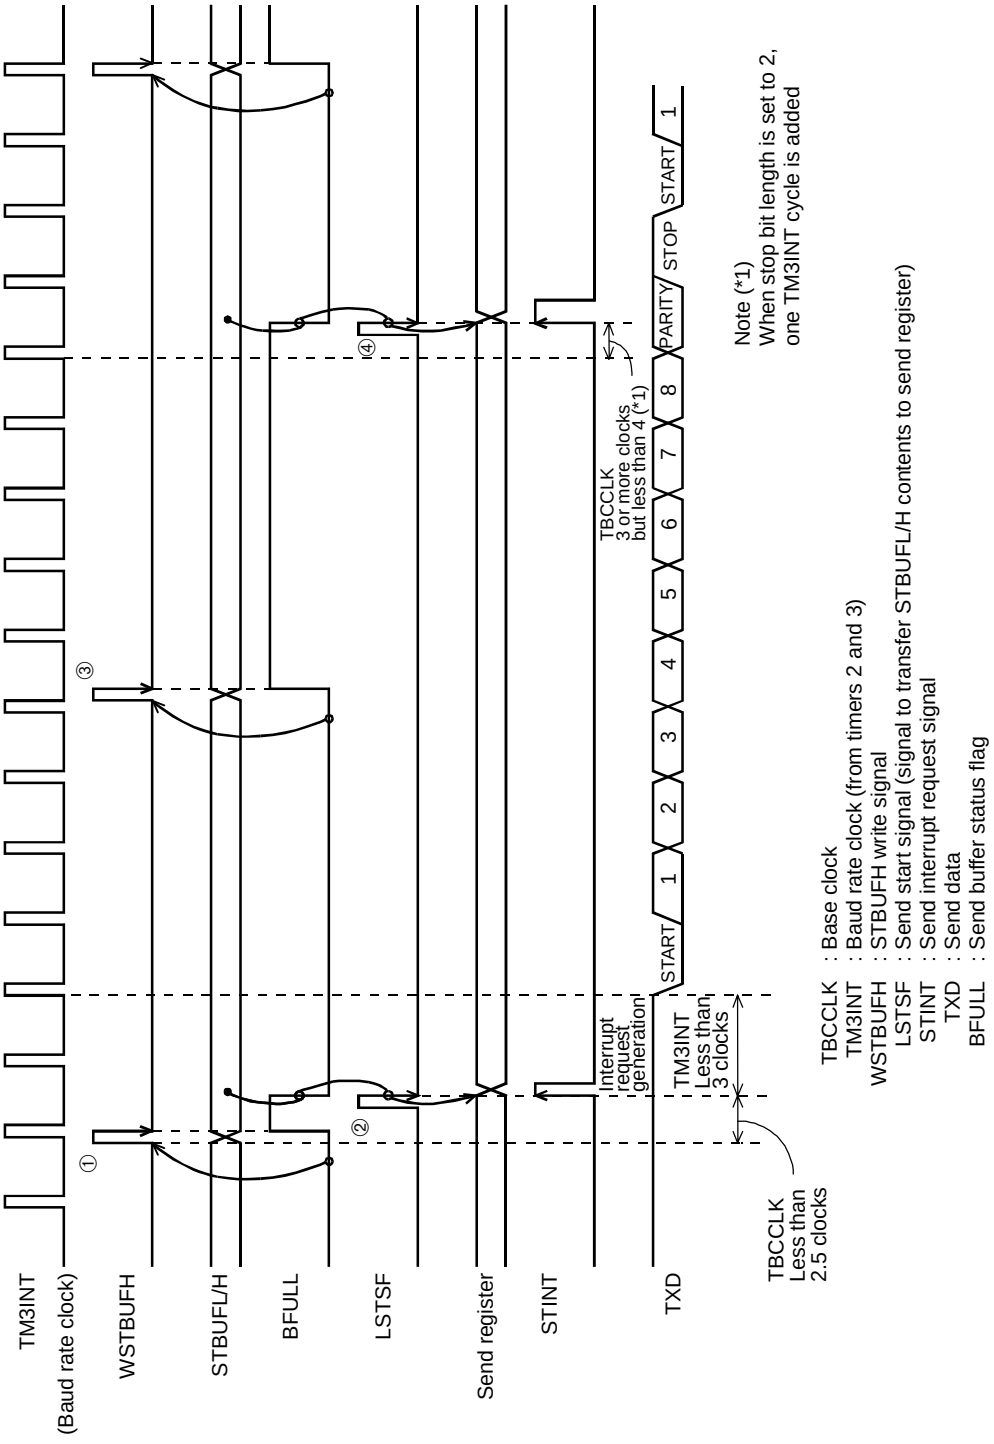

Figure 13-5 UART Mode Send Timing Chart

(for data length 8 bits, 1 stop bit, with parity bit)

(2) Synchronous internal clock mode

The synchronous internal clock mode is selected by setting STMOD (bit 0 of STCON0) to "1", and STCLK (bit 0 of STCON1) to "1".

Figure 13-6 is the send timing chart for the synchronous internal clock mode.

The synchronous internal clock send procedure is described below.

First the send format (data bit length, parity bit, etc.) is set to STCON0 and STCON1.

① Set send data to STBUFL/H.

② The send data is transferred from STBUFL/H to the send register, and send operation begins. At the same time the interrupt request signal (STINT) is generated.

③ Check that BFULL = "0", then set the next send data to STBUFL/H.

④ When the send operation is complete, the send data set to STBUFL/H is transferred to the send register, and the send operation begins. At the same time, the serial port send interrupt signal (STINT) is generated.

Repeat step ③ the required number of times.

In the synchronous internal clock mode the send baud rate is fixed at the crystal oscillation frequency, that is, the frequency (32.768 kHz) of the time base clock (TBCCLK).

After data is set to STBUFH, the send clock (TXCO) is generated between 2 and 3.5 clocks of the TBCCLK source, and a send operation starts.

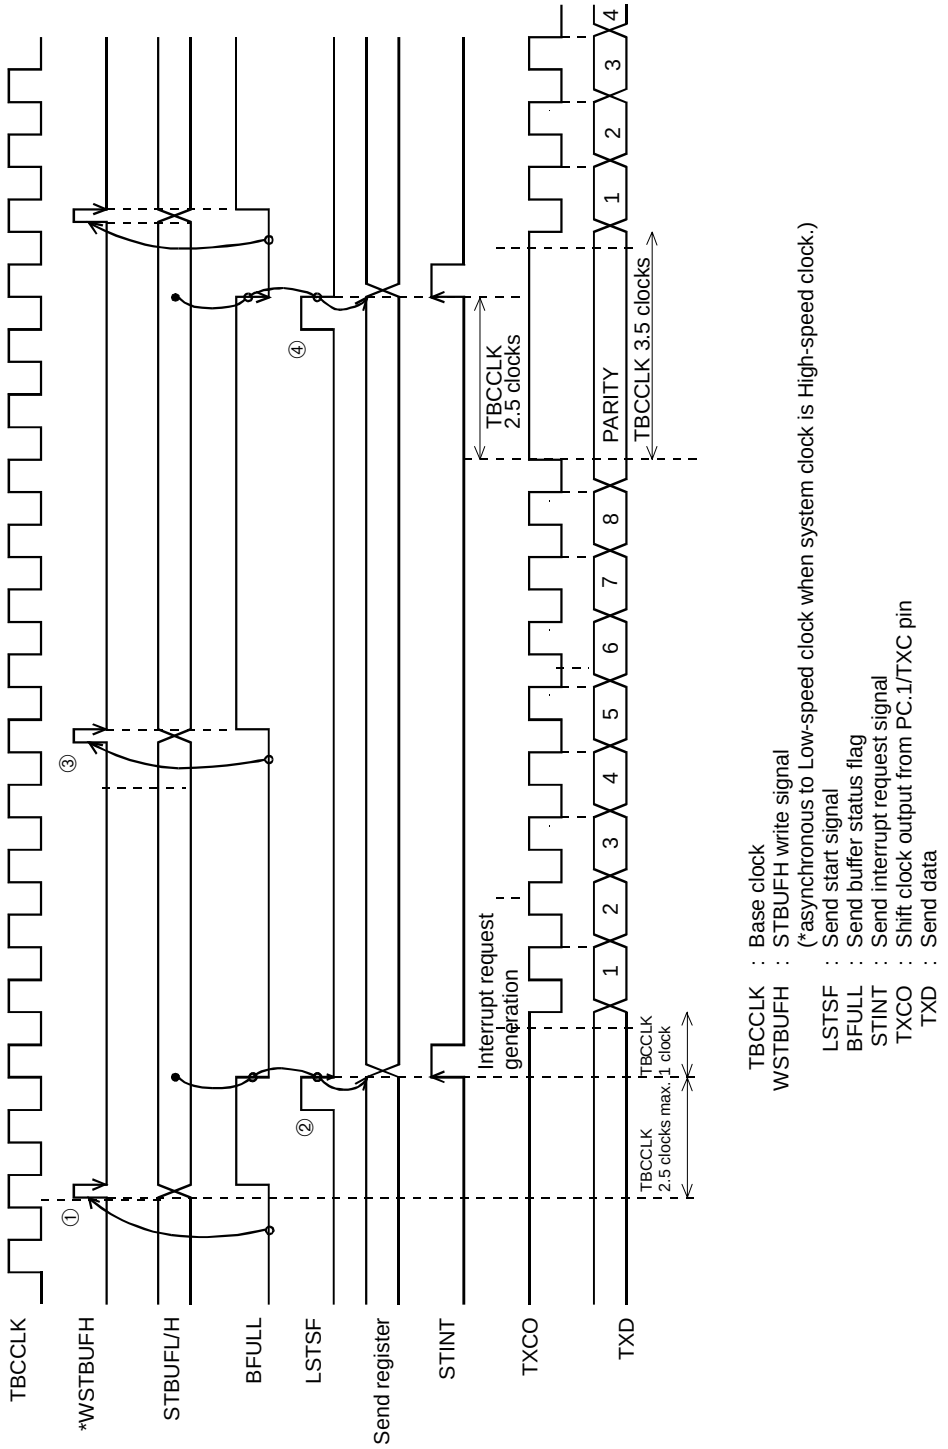

Figure 13-6 Send Timing Chart for Synchronous Internal Clock Mode

(for data length 8 bits, with parity bit)

(3) Synchronous external clock mode

The synchronous external clock mode is selected by setting STMOD (bit 0 of STCON0) to "1", and STCLK (bit 0 of STCON1) to "0".

Figure 13-7 is the send timing chart for the synchronous external clock mode.

The synchronous external clock send procedure is described below.

First set the send format (data bit length, parity bit, etc.) to STCON0 and STCON1.

① Set send data to STBUFL/H.

② The send data is transferred from STBUFL/H to the send register, and at the same time the interrupt request signal (STINT) is generated.

③ Send operation is started by the send shift clock (TXCI).

④ Check that BFULL = "0", then set the next send data to STBUFL/H.

⑤ When the send operation is complete, the send data set to STBUFL/H is transferred to the send register. At the same time, the serial port send interrupt signal (STINT) is generated.

Repeat step ④ the required number of times.

In the synchronous external clock mode the send baud rate is determined by the input shift clock (TXCI).
To send data continuously, keep an interval of at least 3.5 clocks (approx. 107 μs) of TBCCLK for one frame of clocked (TXCI) send data.

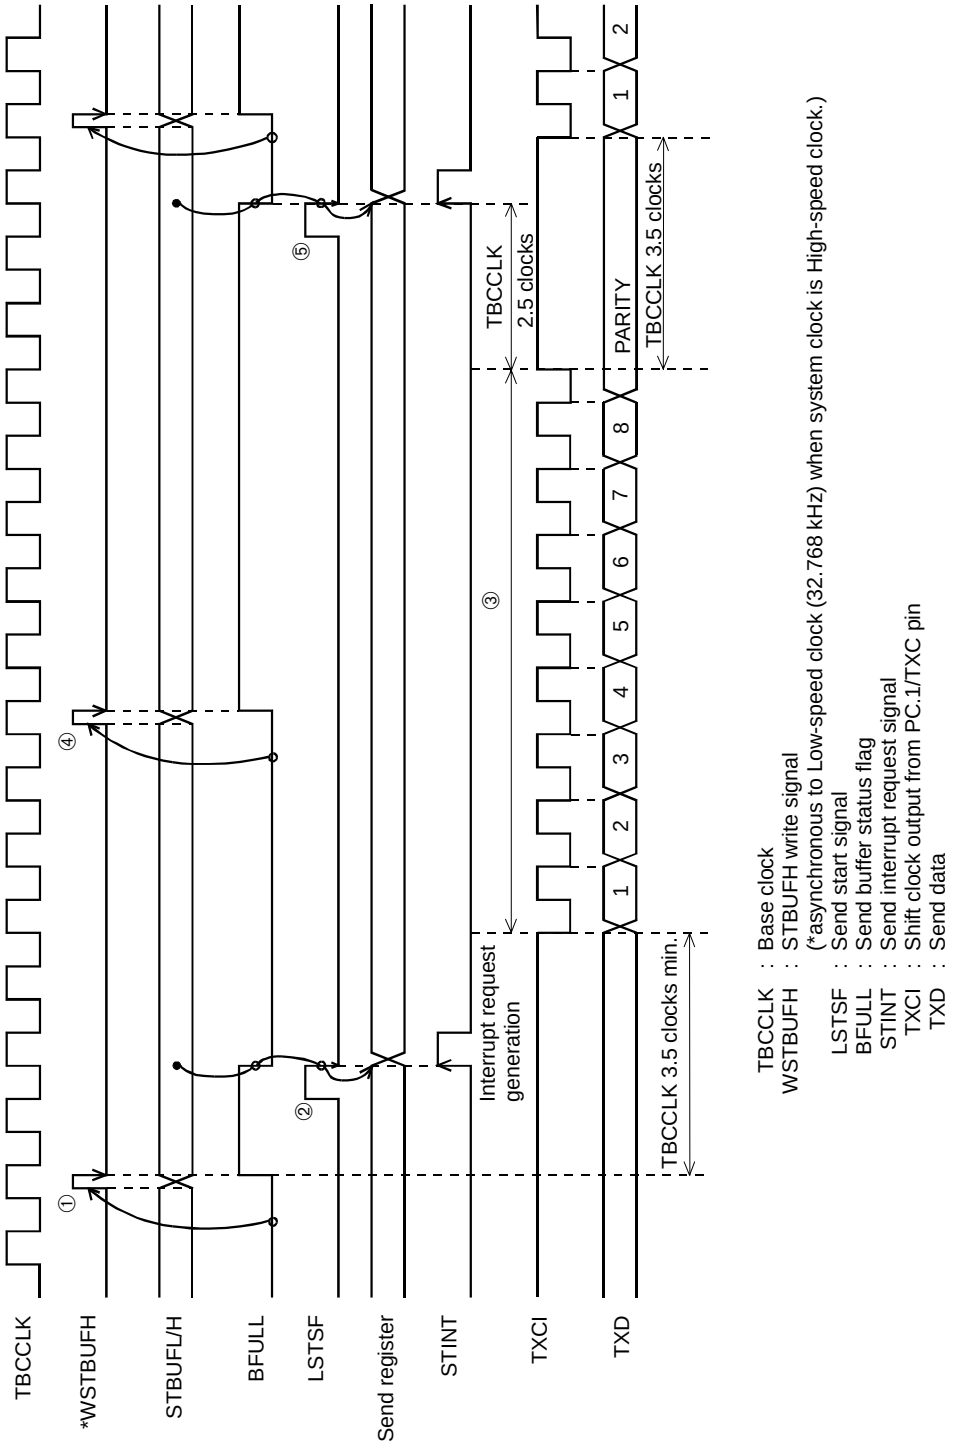

Figure 13-7 Send Timing Chart for Synchronous External Clock Mode

(for data length 8 bits, with parity bit)

13.4.3 Receive Operation Description

(1) UART mode

The UART mode is specified by setting SRMOD (bit 0 of SRCON0) to "0". Figure 13-8 is the UART mode receive timing chart. The UART mode receive procedure is described below.

First set the receive baud rate in the receive baud rate setting register (SRBRT). Supported baud rates for UART mode receive are 1/4 TBCCLK (1200 bps), 1/2 TBCCLK (2400 bps), TBCCLK (4800 bps), and 2 TBCCLK (9600 bps).

Set the receive format (data bit length, parity bit, etc.) in SRCON0 and SRCON1.

① Set SREN (bit 3 of SRCON0) to "1" to enable receive.

② At the negative edge of the receive data (RXD) start bit, receive operation will start.

③ Receive operation ends.

If a framing or overrun error occurs the FERR or OERR flag of the status register (SSTAT) will be set to "1".

④ Received data is transferred to SRBUFL/H.

If a parity error occurs, the PERR flag of the status register (SSTAT) is set to "1".

⑤ The serial port receive interrupt request (SRINT) is generated.

Receive data is received until receive is disabled (SREN = "0"). When receive is ended, reset the receive enable/disable flag (SREN) to "0".

The receive data sampling clock (SRSMPL) is based on the low-speed clock supply, not on the high-speed clock. This allows receive operations to be executed while in the energy-saving mode.

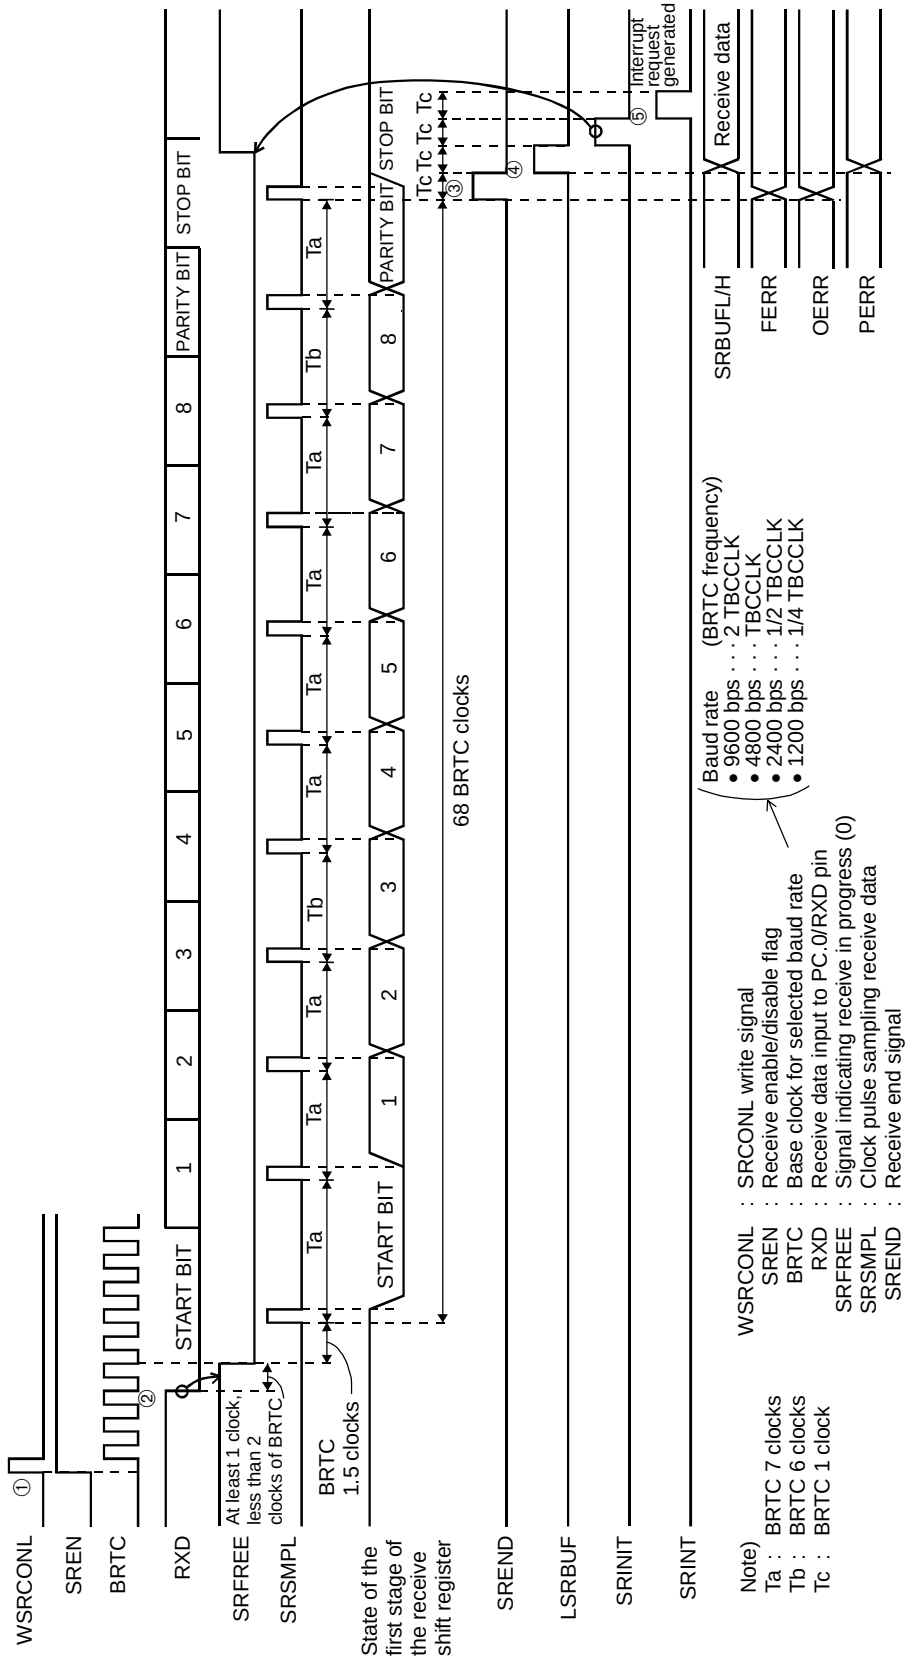

Figure 13-8 UART Mode Receive Timing Chart
(for data length 8 bits, with parity bit)

(2) Synchronous internal clock mode

The synchronous internal clock mode is selected by setting SRMOD (bit 0 of SRCON0) to "1" and SRCLK (bit 0 of SRCON1) to "1".

Figure 13-9 is the receive timing chart for the synchronous internal clock mode.

The synchronous internal clock receive procedure is indicated below.

First set the receive format (data bit length, parity bit, etc.) in SRCON1 and SRCON0.

① Set SREN (bit 3 of SRCON0) to "1" (receive enable).

② 3 to 4 BRTC clock cycles later the receive shift clock (RXCO) is generated, and the receive operation starts.

(The shift clock is supplied from the PC.2/RXC pin.)

③ At the positive edge of RXCO the data received from the PC.0/RXD pin is written to the receive register.

④ Receive operation ends.

If an overrun error occurs the OERR flag in status register (SSTAT) is set to "1".

⑤ Received data is transferred to SRBUFL/H.

If a parity error occurs, the PERR flag of status register (SSTAT) is set to "1".

⑥ The serial port receive interrupt request signal (SRINT) is generated.

⑦ At the negative edge of SRINT, SREN is reset to "0".

Repeat step ① the required number of times. In the synchronous internal clock mode the receive baud rate is fixed to TBCCLK.

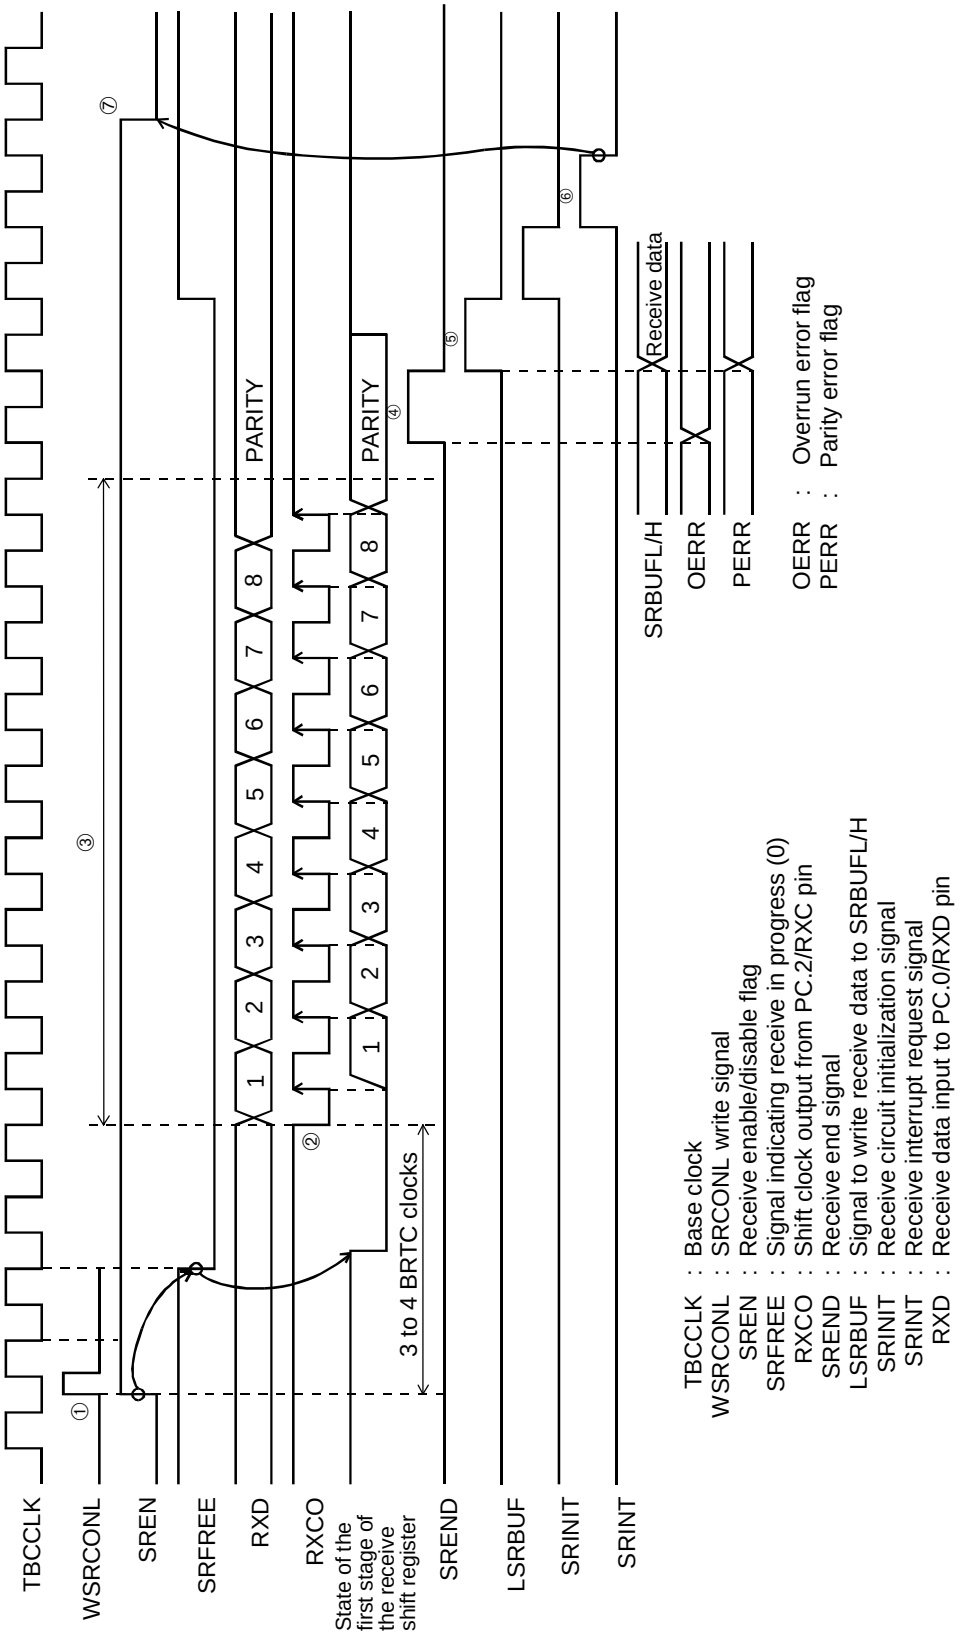

Figure 13-9 Synchronous Internal Clock Mode Receive Timing Chart

(for data length 8 bits, with parity bit)

(3) Synchronous external clock mode

The synchronous external clock mode is selected by setting SRMOD (bit 0 of SRCON0) to "1" and SRCLK (bit 0 of SRCON1) to "0".

Figure 13-10 is the receive timing chart for the synchronous external clock mode.

The synchronous external clock receive procedure is indicated below.

First set the receive format (data bit length, parity bit, etc.) in SRCON1 and SRCON0.

① Set SREN (bit 3 of SRCON0) to "1" (receive enable).

② At the positive edge of the receive shift clock input through PC.2/RXC pin, the receive data from PC.0/RXD pin is written to the receive register.

③ Receive operation ends.

If an overrun error occurs the OERR flag in status register (SSTAT) is set to "1".

④ Received data is transferred to SRBUFL/H.

If a parity error occurs, the PERR flag of status register (SSTAT) is set to "1".

⑤ The serial port receive interrupt request signal (SRINT) is generated.

⑥ At the negative edge of SRINT, SREN is reset to "0".

Repeat step ① the required number of times.

In the synchronous external clock mode the receive baud rate is determined by the external clock (RXCI). Allow at least five clocks (approx. 153 µs) of TBCCLK between the time the receive is enabled (SREN = "1") and the time the external clock (RXCI) is input.

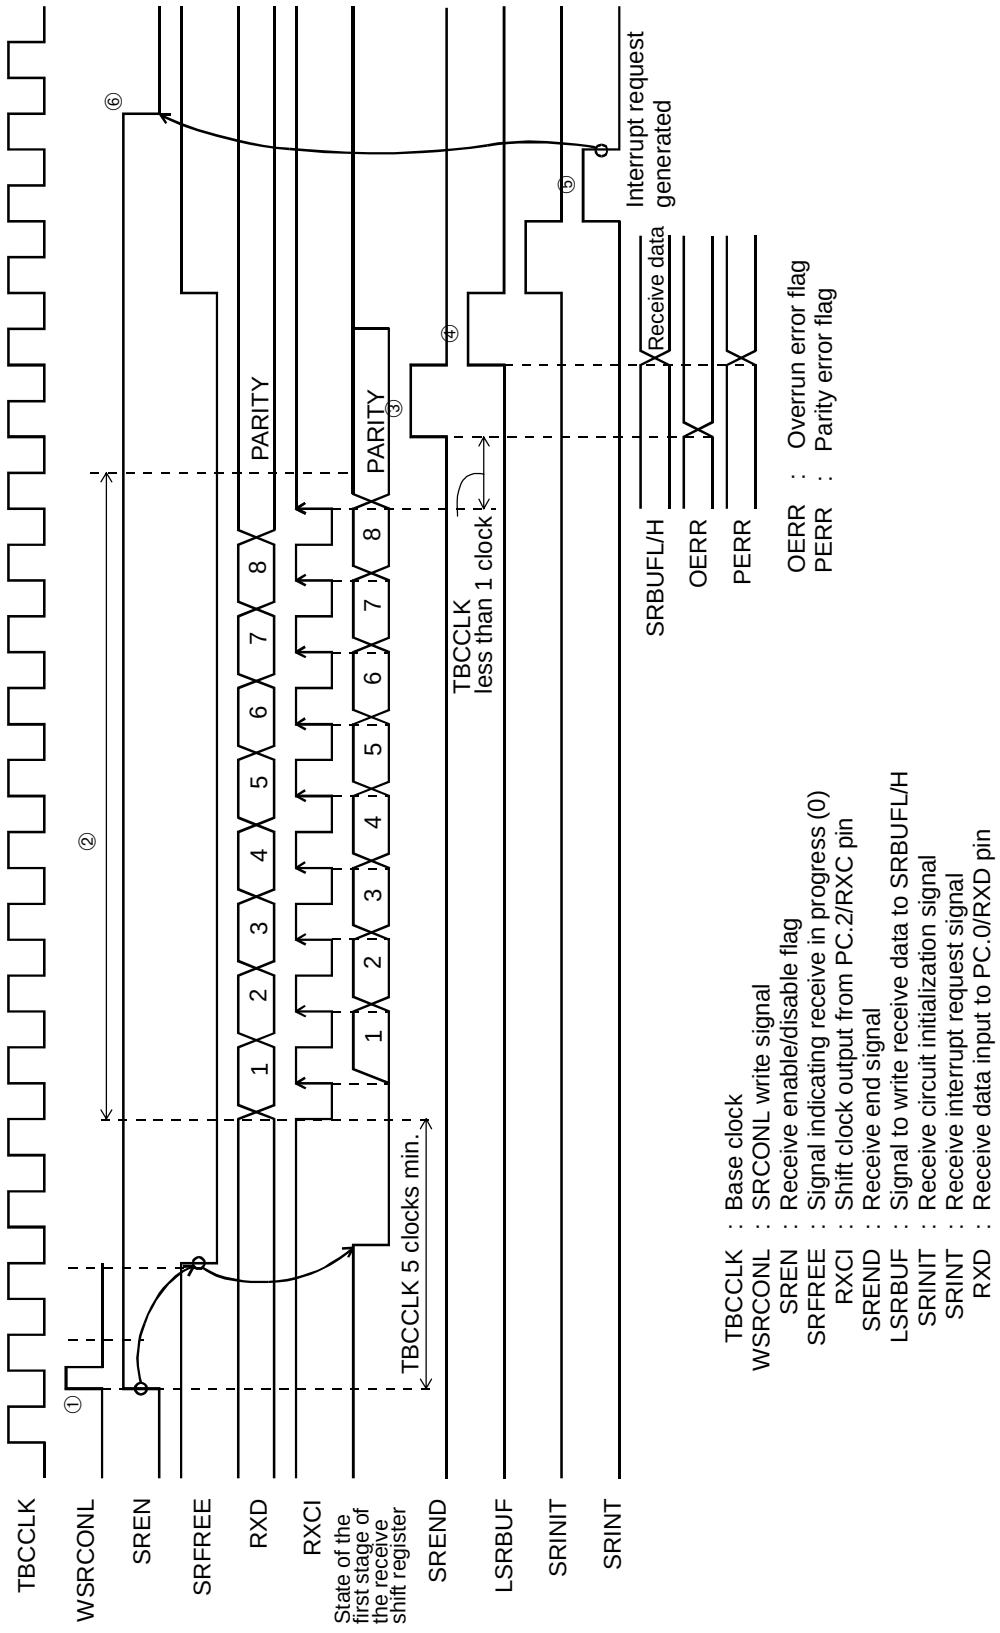

Figure 13-10 Synchronous External Clock Mode Receive Timing Chart

(for data length 8 bits, with parity bit)

13.5 Send/Receive Data LSB/MSB First Select

Either LSB first or MSB first for send can be selected by setting STLMB (bit 3 of STCON1).

Either LSB first or MSB first for receive can be selected by setting SRLMB (bit 3 of SRCON1).

13.5.1 Selecting Send Data LSB/MSB First

Set STLMB (bit 3 of STCON1) to "0" to select LSB first for send.

The correspondence between LSB first send data and the send buffer register bit is shown in Figure 13-11. In this case, the LSB is TB0 (bit 0 of STBUFL).

Set STLMB to "1" to send the MSB first.

The correspondence between MSB first send data and the send buffer register bit is shown in Figure 13-12. In this case, the MSB is TB7 (bit 3 of STBUFH).

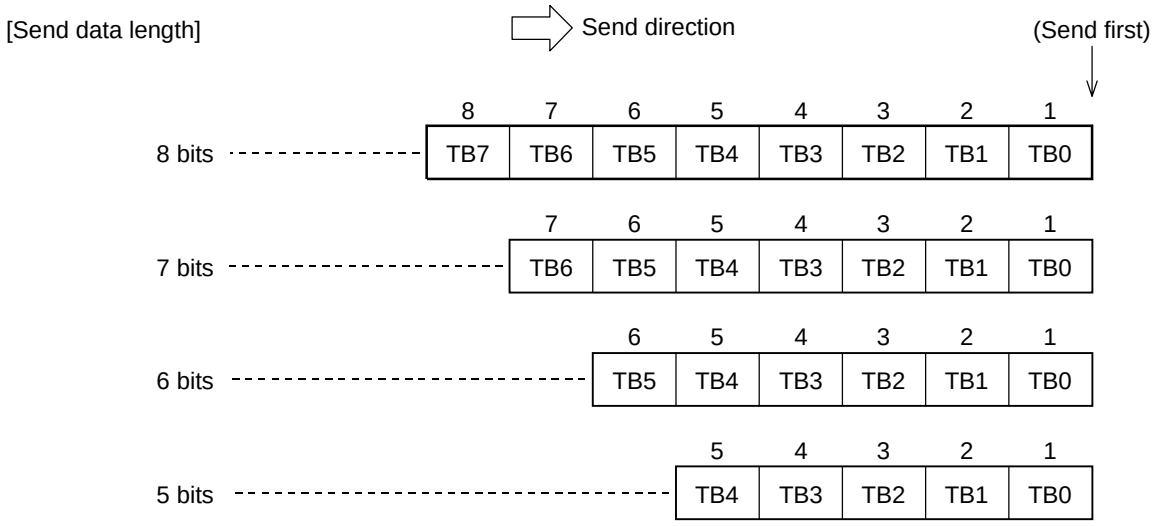

Figure 13-11 Correspondence Between LSB First Send Data and Send Buffer Register

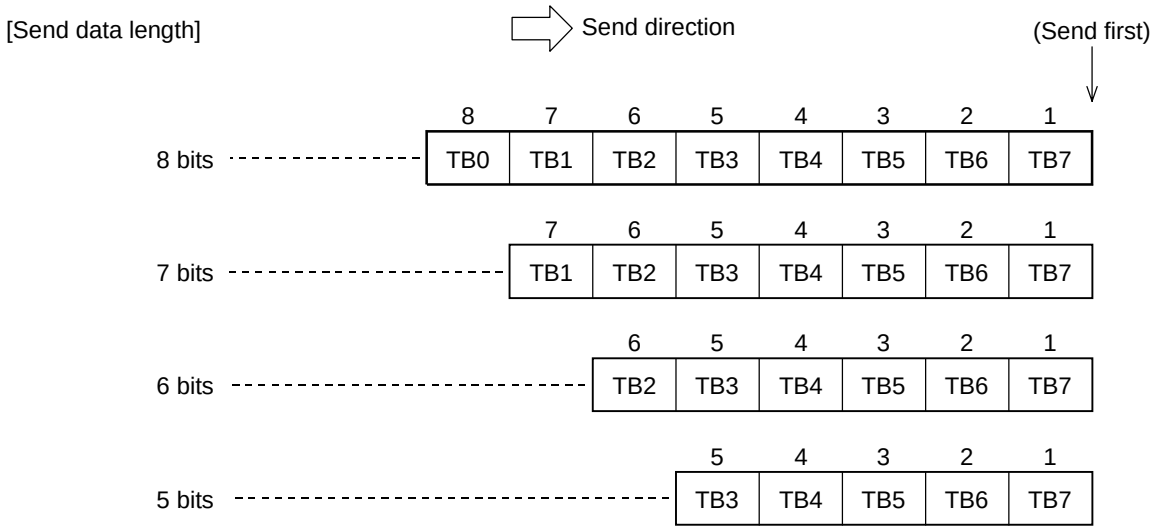

Figure 13-12 Correspondence Between MSB First Send Data and Send Buffer Register

13.5.2 Selecting Receive Data LSB/MSB First

When the LSB is first in receive data, set SRLMB (bit 3 of SRCON1) to "0".

If the MSB is first, set SRLMB to "1".

The correspondence between receive data and SRBUFL/H bits for LSB first receive is shown in Figure 13-13, and for MSB first receive in Figure 13-14.

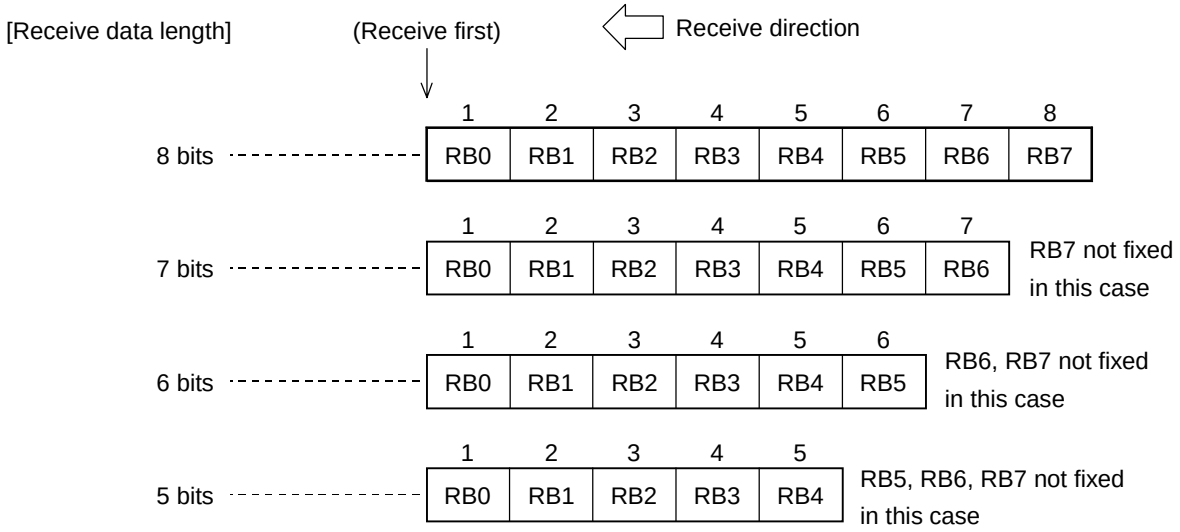

Figure 13-13 Correspondence Between LSB First Receive Data and Receive Buffer Register

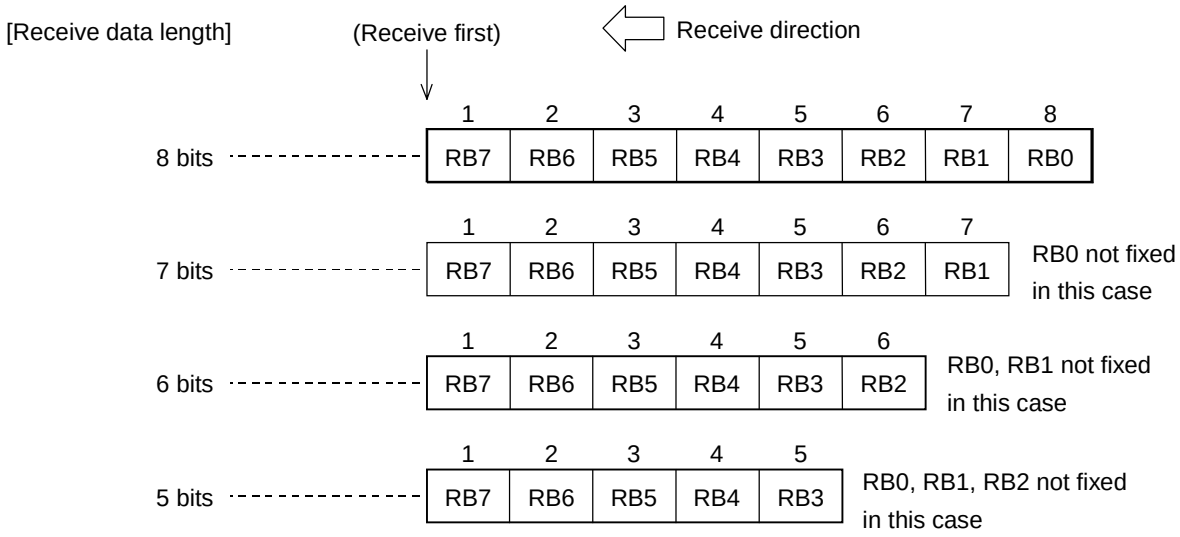

Figure 13-14 Correspondence Between MSB First Receive Data and Receive Buffer Register

Chapter 14

Shift Register (SFT)

14. Shift Register (SFT)

14.1 Overview

The ML63295A has one internal 8-bit shift register channel for clock synchronous communication.

The shift register is synchronized with the clock specified by the shift register control register 0 (SFTCON0), and can perform 8-bit data send and receive simultaneously. When 8-bit data transfer is completed, a shift register interrupt request is generated.

14.2 Shift Register Configuration

The shift register configuration is shown in Figure 14-1.

PE.0/SIN, PE.1/SOUT, and PE.2/SCLK are the shift data input pin, the shift data output pin and the shift clock input/output pin respectively. Set the secondary function by using port mode register.

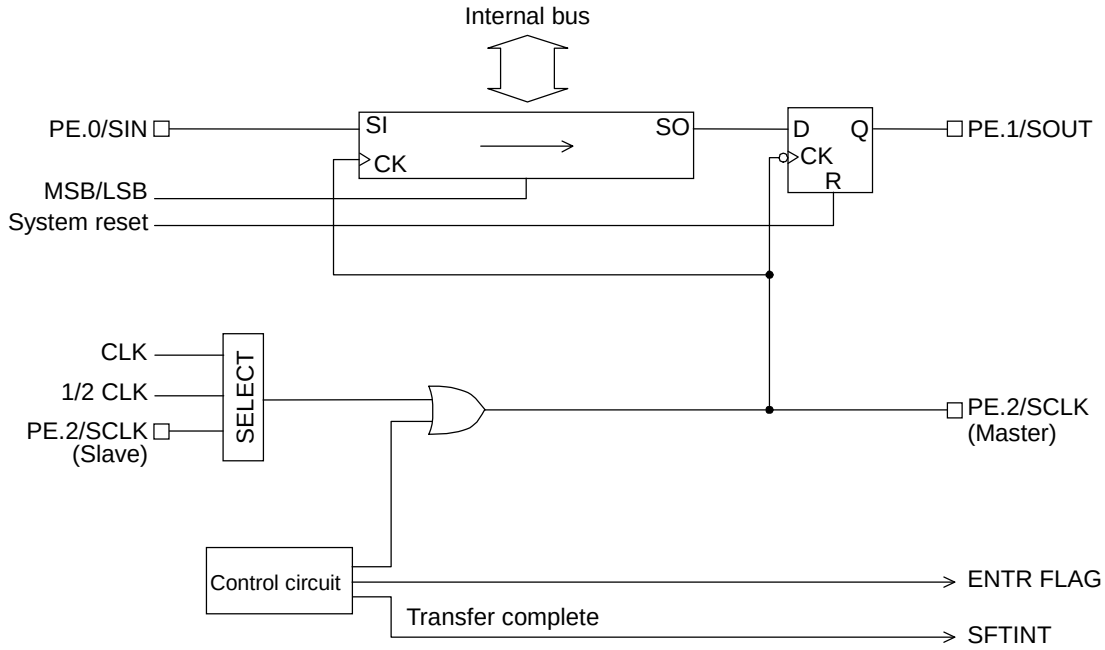

Figure 14-1 Shift Register Configuration

14.3 Shift Registers

(1) Shift registers L/H (SFTRL, SFTRH)

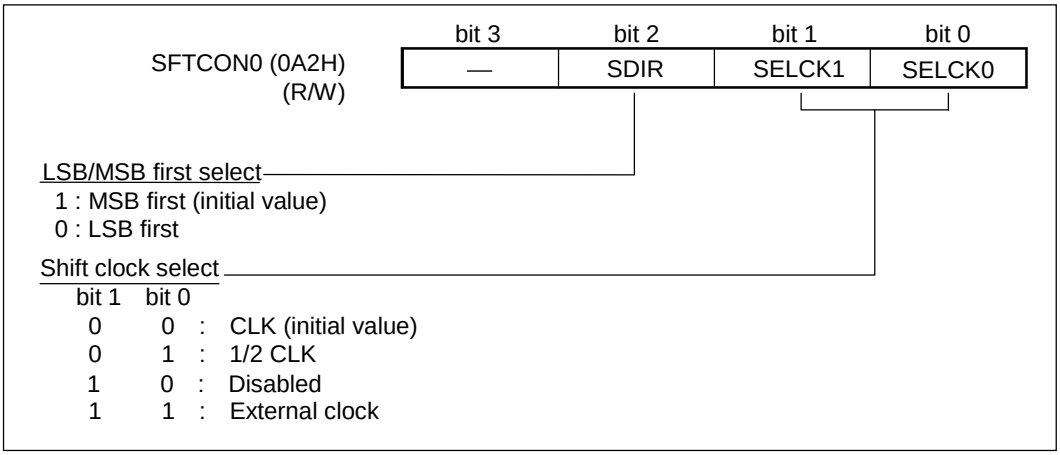
SFTRL and SFTRH are 4-bit special function registers (SFRs) used to write shift register send data and to read receive data.

	bit 3	bit 2	bit 1	bit 0
SFTRL (0A0H) (R/W)	SD3	SD2	SD1	SD0
	bit 3	bit 2	bit 1	bit 0
SFTRH (0A1H) (R/W)	SD7	SD6	SD5	SD4

SFTRL and SFTRH are set to "0" at system reset.

(2) Shift register control registers (SFTCON0, SFTCON1)

SFTCON0 and SFTCON1 are 4-bit special function registers (SFRs) that control shift register operation. At system reset both are initialized to "0".

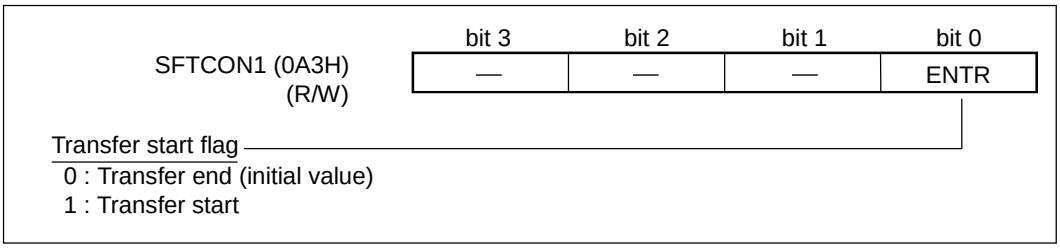


bit 2: SDIR

This bit selects the transfer order for 8-bit send/receive data.
When the SDIR bit is "0" it means MSB first, and when "1", LSB first.

bit 1, 0: SELCK1, SELCK0

These bits select the shift clock.
If set to CLK or 1/2 CLK the system operates in master mode. If set to external clock the system operates in slave mode.



bit 0: ENTR

When ENTR is set to "1", transfer starts, and when 8-bit transfer ends, it is automatically set to "0".

14.4 Shift Register Operation

The shift register can be set to master or slave mode, and to MSB first or LSB first. The send data is written to the shift register (SFTRL, SFTRH), and transfer is started by setting bit 0 (ENTR) of the shift control register 1 (SFTCON1) to "1". After 8-bit data transfer (send/receive), operation ends.

Bits 1 and 0 (SELCK1, SELCK0) of the shift control register 0 (SFTCON0) can set the shift clock to CLK or 1/2 CLK. This operation is master mode and the shift clock is output to the PE.2/SCLK pin.

When the shift clock is set to external clock, the system operates in slave mode, and operation is to the clock input through the PE.2/SCLK pin. If eight or more clocks are input consecutively, the ninth and following clocks are ignored.

In both master and slave modes, the shift register is synchronized to the shift clock falling edge, and shift-out data is output from the first bit through the PE.1/SOUT pin. In synchronization with the shift clock rising edge, shift-in data is input from the first bit through the PE.0/SIN pin.

For external devices, shift-in data changes on the falling edge of the shift clock, and shift-out data changes on the rising edge of the shift clock.

When 8-bit data transfer is complete, bit 0 (ENTR) of SFTCON1 is cleared to "0". When transfer is completed, the interrupt request signal (SFTINT) is generated (see Figure 14-2).

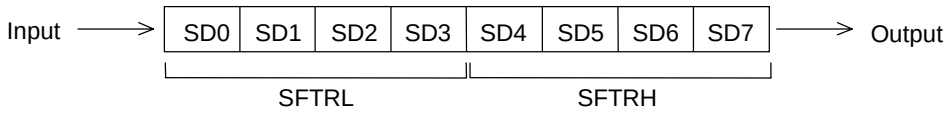
The output pin state at system reset and between transfers (from the end of one 8-bit transfer until the next transfer starts) is shown in Table 14-1 (when set to the output secondary function).

Table 14-1 Output Pin States

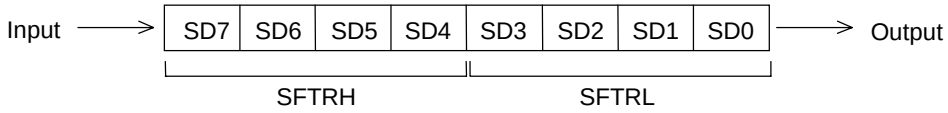
Pin name	At system reset	Between transfers
PE.2/SCLK	"H"	"H"
PE.1/SOUT	"L"	Last transfer data of transfer

MSB/LSB first is set to bit 2 (SDIR) of SFTCON0.

- SDIR = 0: MSB first mode



- SDIR = 1: LSB first mode



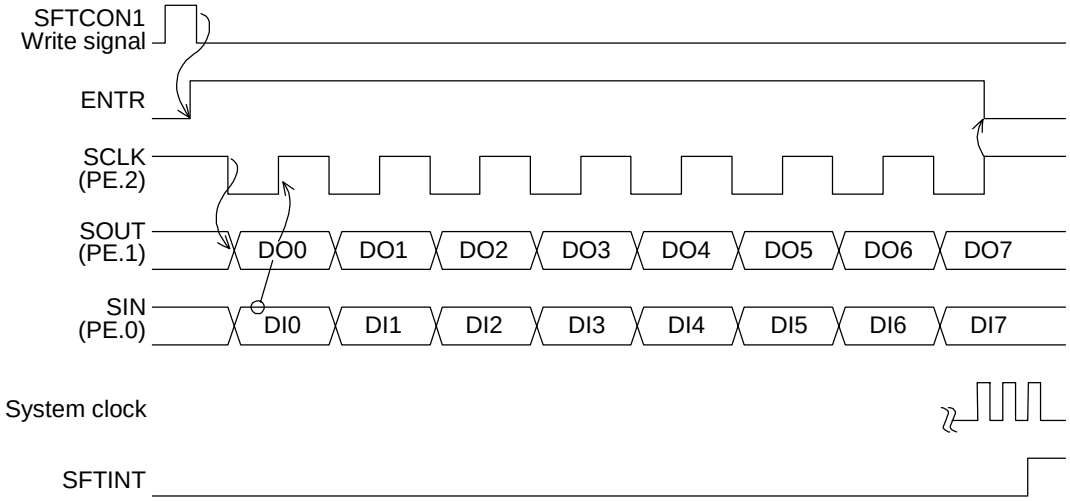


Figure 14-2 Shift Register Operation Timing

Note:

Setting the ENTR bit to "1" in the slave mode should be done when the PE.2/SCLK pin is high.

If SFTRL/SFTRH are written during transfer, the transfer data (send and receive) is destroyed. In this case, terminate the transfer and start over again.

Even when receiving only, transfer begins with setting the ENTR bit to "1".

14.5 Shift Register Application Example

An example of register setting for clock synchronous communication using shift register is described below.

(1) Set the supported port modes (secondary function).

Port control register	Master mode	
PEMOD	Bit 2 = "1"	(PE.2/SCLK)
	Bit 1 = "1"	(PE.1/SOUT)
	Bit 0 = "1"	(PE.0/SIN)

(2) Select the shift clock with SELCK1 and SELCK0 (SFTCON0 bits 1 and 0)(master/slave mode select).

(3) Select MSB first/LSB first with SDIR (SFTCON0 bit 2). ("0" for MSB first, and "1" for LSB first).

(4) Set ESFT (IE3 bit 2) to "1" and enable the shift register interrupt.

(5) Set the MIE (master interrupt enable flag) to "1", and enable all interrupts.

(6) Write send data to SFTRL and SFTRH.

(7) Set ENTR (bit 0 of SFTCON1) to "1", and start the transfer.

With the above settings the shift register begins to operate, and the CPU receives the shift register interrupt.

Whether 8-bit transfer has been completed can be checked by monitoring QSFT (bit 2 of IRQ3) or ENTR (bit 0 of SFTCON1).

Chapter 15

LCD Driver (LCD)

15. LCD Driver (LCD)

15.1 Overview

The ML63295A has an internal dot matrix LCD driver. It also has 96 segment outputs and can drive up to 3072 (96 seg. × 32 com.) dots. The LCD driver can be software-selected to all OFF, all ON or power down mode, 1/5 or 1/6 bias. In addition, by software, duty from 1/2 to 1/32 can be selected and display contrast of 16 tones can be controlled.

15.2 LCD Driver Configuration

The LCD driver configuration is shown in Figure 15-1.

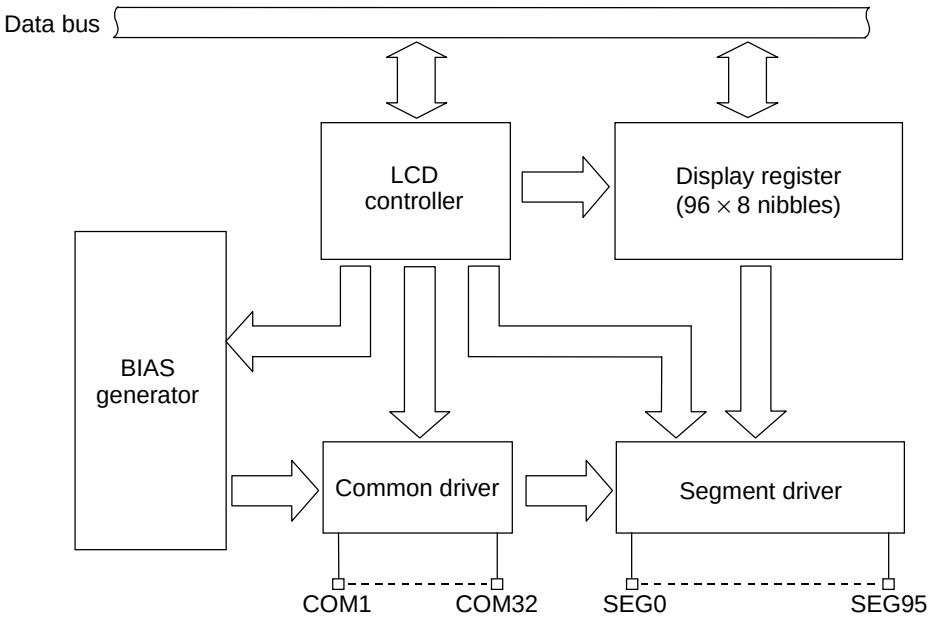

Figure 15-1 LCD Driver Configuration

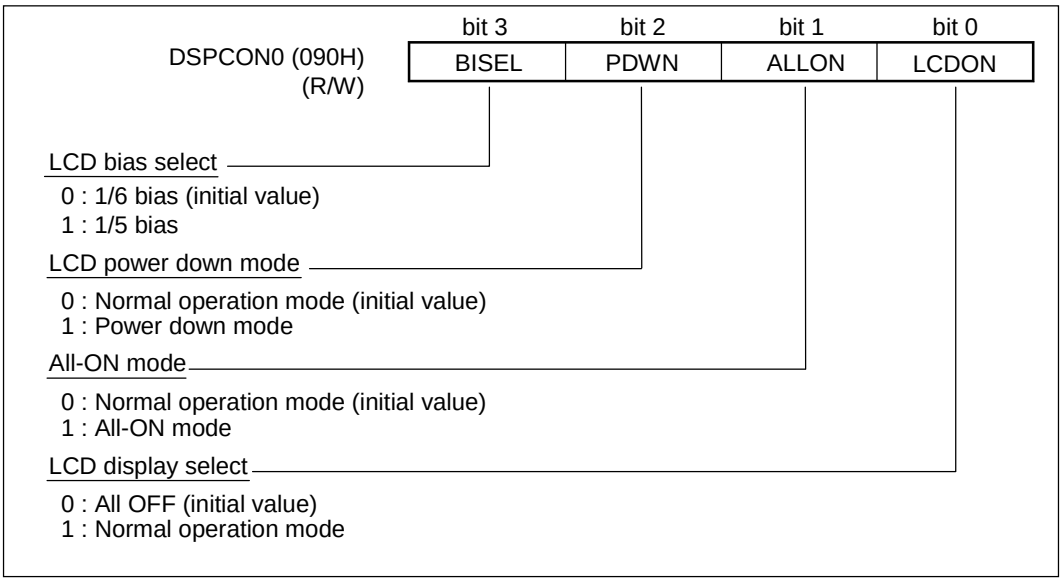
15.3 LCD Driver Registers

(1) Display control register 0 (DSPCON0)

DSPCON0 is a 4-bit special function register (SFR) controlling LCD driver operation.



bit 3: BISEL

This bit selects 1/6 or 1/5 bias.
At system reset it is "0", selecting 1/6 bias.

bit 2: PDWN

This bit selects the LCD power down mode. When PDWN is set to "1", the bias generation circuit stops its voltage boosting operation and pins COM1–32 and SEG0–95 are all set to the V_{SS} level, reducing supply current. At system reset it is cleared to "0".

bit 1: ALLON

When ALLON is set to "1" all segment drivers are turned on. The ALLON bit has priority over the LCDON bit. At system reset it is cleared to "0".

bit 0: LCDON

When the LCDON bit is set to "1", the display data in the display register is output to the segment drivers. At system reset it is cleared to "0", and all segment drivers are turned off.

(2) Display control register 1 (DSPCON1)

DSPCON1 is a 4-bit special function register (SFR) used to select the LCD driver duty.

At system reset, each bit of DSPCON1 is initialized to "0".

DSPCON1 (091H) (R/W)

bit 3	bit 2	bit 1	bit 0
DT3	DT2	DT1	DT0

Duty select

bit 3	bit 2	bit 1	bit 0		
0	0	0	0	:	1/32 duty (initial value)
0	0	0	1	:	1/2 duty
0	0	1	0	:	1/4 duty
0	0	1	1	:	1/6 duty
0	1	0	0	:	1/8 duty
0	1	0	1	:	1/10 duty
0	1	1	0	:	1/12 duty
0	1	1	1	:	1/14 duty
1	0	0	0	:	1/16 duty
1	0	0	1	:	1/18 duty
1	0	1	0	:	1/20 duty
1	0	1	1	:	1/22 duty
1	1	0	0	:	1/24 duty
1	1	0	1	:	1/26 duty
1	1	1	0	:	1/28 duty
1	1	1	1	:	1/30 duty

(3) Display contrast register (DSPCNT)

DSPCNT is a 4-bit special function register (SFR) used to control display contrast.

At system reset, each bit of DSPCON1 is initialized to "0".

DSPCNT (092H) (R/W)

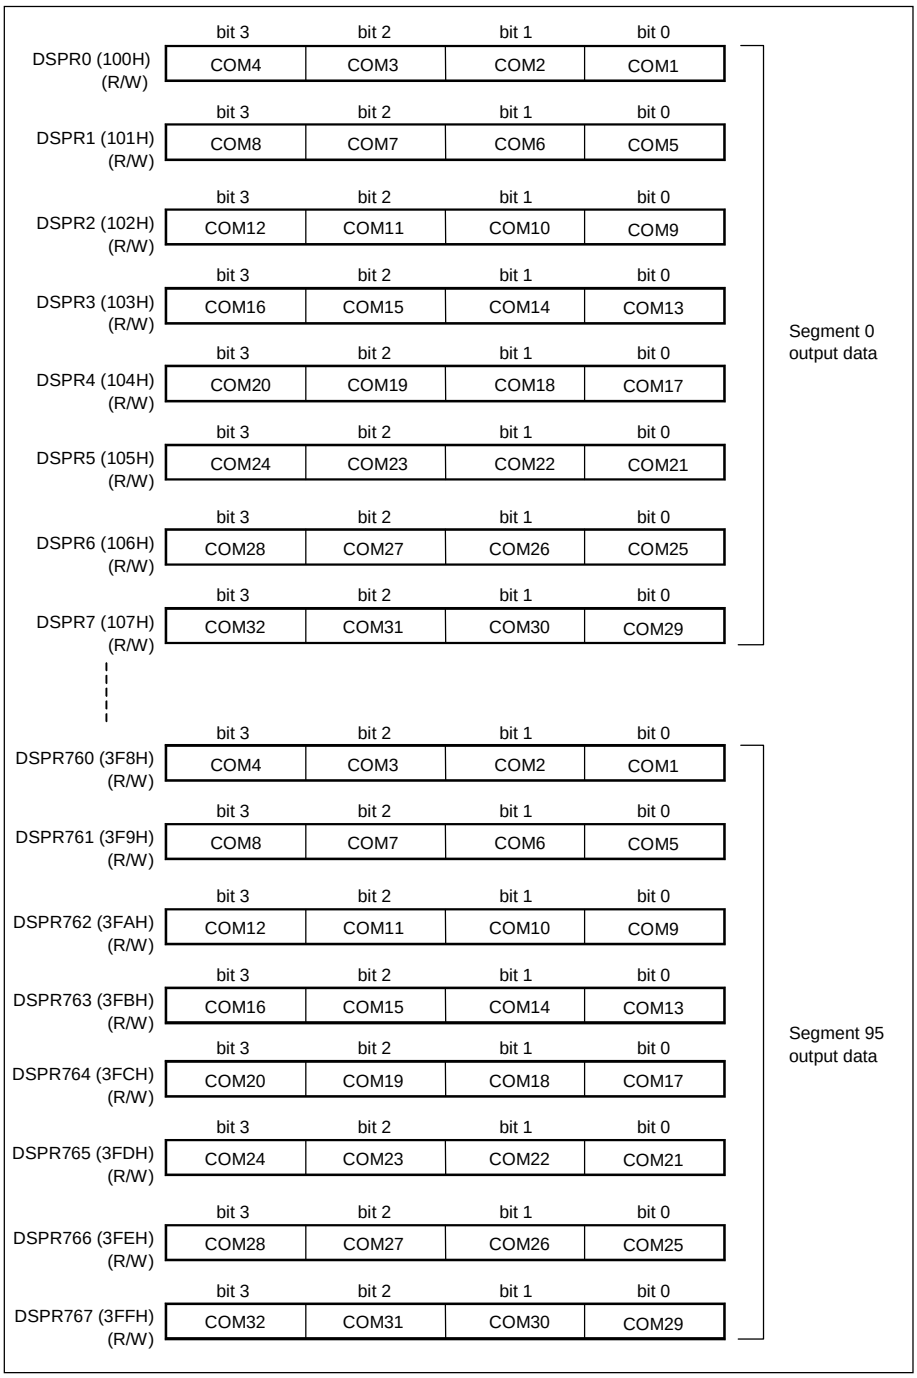
bit 3	bit 2	bit 1	bit 0
CN3	CN2	CN1	CN0

Contrast select

bit 3	bit 2	bit 1	bit 0		
0	0	0	0	:	Light (initial value)
0	0	0	1	:	
0	0	1	0	:	
0	0	1	1	:	
0	1	0	0	:	
0	1	0	1	:	
0	1	1	0	:	
0	1	1	1	:	
1	0	0	0	:	
1	0	0	1	:	
1	0	1	0	:	
1	0	1	1	:	
1	1	0	0	:	
1	1	0	1	:	
1	1	1	0	:	
1	1	1	1	:	Dark

(4) Display registers (DSPR0 to DSPR767)

DSPR0 to DSPR767 are segment output data registers for the dot matrix LCD driver allocated to RAM BANKS 1 to 3. The correspondence between display registers and segment outputs is shown below.



Note:

- When a display register bit is set to "1", the corresponding LCD dot lights. When reset to "0" it goes off.
- To keep stable display state, each individual LCD dot should be set to ON/OFF with bit operation instructions.
- At system reset the display registers (DSPR0 to DSPR767) are undefined and should be initialized.

15.4 LCD Driver Operation

The display duty is selected from 1/2 to 1/32 using DSPCON1. The frame frequency for each duty ratio is indicated in Table 15-1. Depending on the duty selected, the common signal (COM1 to COM32) is generated, and data written in synchronization with that common signal to the display registers (DSPR0 to DSPR767) is output to the segment driver. The segment driver uses bits 0 and 1 (ALLON, LCDON) of the display control register 0 (DSPCON0) to control all OFF and all ON modes.

When PDWN (bit 2 of DSPCON0) is set to "1", the LCD power down mode is enabled. In the LCD power-down mode the bias generation circuit operation stops, and the COM1–32 and SEG0–95 pins are all output at the V_{SS} level to reduce supply current.

BISEL (bit3 of DSPCON0) selects 1/6 or 1/5 bias.

DSPCNT controls the LCD contrast of 16 tones.

Table 15-1 Frame Frequency for Each Duty

DSPCON1					Duty	Frame frequency
DT3–0	DT3	DT2	DT1	DT0		
0H	0	0	0	0	1/32	64 Hz
1H	0	0	0	1	1/2	1024 Hz
2H	0	0	1	0	1/4	512 Hz
3H	0	0	1	1	1/6	approx. 341 Hz
4H	0	1	0	0	1/8	256 Hz
5H	0	1	0	1	1/10	approx. 205 Hz
6H	0	1	1	0	1/12	approx. 171 Hz
7H	0	1	1	1	1/14	approx. 146 Hz
8H	1	0	0	0	1/16	128 Hz
9H	1	0	0	1	1/18	approx. 114 Hz
0AH	1	0	1	0	1/20	approx. 102 Hz
0BH	1	0	1	1	1/22	approx. 93 Hz
0CH	1	1	0	0	1/24	approx. 85 Hz
0DH	1	1	0	1	1/26	approx. 79 Hz
0EH	1	1	1	0	1/28	approx. 73 Hz
0FH	1	1	1	1	1/30	approx. 68 Hz

Note:

When the LCD driver is not used, select the power-down mode and set all the bits of the display control register (DSPCNT) to "0" to save the supply current.

15.5 Bias Generator (BIAS)

The bias generator boosts a voltage (V_{DDE}) generated by the voltage regulator circuit up to a bias reference voltage by external capacitors connected to pins C1, C2, V_{DDX2}, and V_{DDX3}. The resistor ladder circuit divides the bias voltages V_{DD1} to V_{DD6} for an LCD driver.

In the LCD power-down mode, the bias reference voltage generation circuit stops boosting to suppress supply current.

Tables 15-2 and 15-3 list display contrast control voltages.

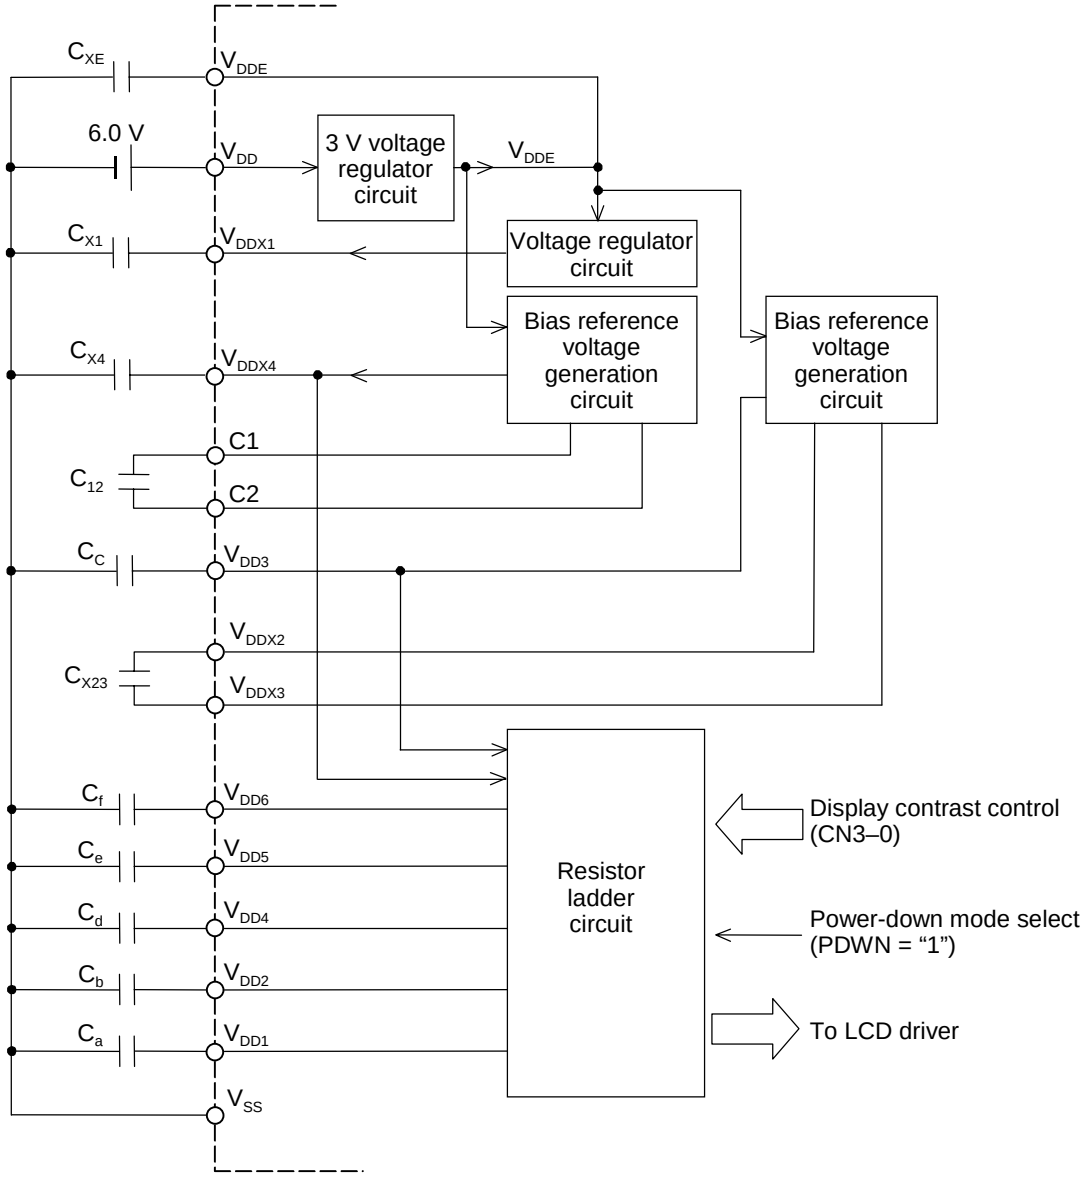


Figure 15-2 Bias Generator Circuit Configuration for 1/6 Bias (Power Supply Voltage = 6 V)

Table 15-2 Display Contrast Control Voltages (V_{DD6}) for 1/6 and 1/5 Biases

Chapter 16

Multiplication/Division Circuit (MULDIV)

16. Multiplication/Division Circuit (MULDIV)

16.1 Overview

The ML63295A has an 8-bit × 8-bit = 16-bit multiplication (MUL) and a 16-bit/8-bit = 16-bit division (DIV), implemented with an internal circuit.

The registers used are shown in Table 16-1.

Table 16-1 Registers Used in Multiplication and Division Circuit

Register name	Symbol	Address	bit 3	bit 2	bit 1	bit 0	R/W	Value at system reset
Multiplication/division condition register	MDCR	086H	OV	EF	DIVS	MULS	R/W	0H
C register L	CRL	087H	CR3	CR2	CR1	CR0	R/W	0H
C register H	CRH	088H	CR7	CR6	CR5	CR4	R/W	0H
D register L	DRL	089H	DR3	DR2	DR1	DR0	R/W	0H
D register H	DRH	08AH	DR7	DR6	DR5	DR4	R/W	0H
E register L	ERL	08BH	ER3	ER2	ER1	ER0	R/W	0H
E register H	ERH	08CH	ER7	ER6	ER5	ER4	R/W	0H
F register L	FRL	08DH	FR3	FR2	FR1	FR0	R/W	0H
F register H	FRH	08EH	FR7	FR6	FR5	FR4	R/W	0H

For multiplication the C register is multiplied by the E register. The result is stored in the DC register (D: high-order 8 bits, C: low-order 8 bits) after 5 machine cycles.

For division the D register is divided by the E register. The result is stored in the DC register (dividend) and F register (remainder) after 10 machine cycles.

16.2 Multiplication and Division Registers

16.2.1 Calculation Registers

The multiplication and division calculation registers (CRL, CRH, DRL, DRH, ERL, ERH, FRL, FRH) are 4-bit special function registers (SFRs), used to set multiplier, multiplicand, divisor, and dividend and store results.

	bit 3	bit 2	bit 1	bit 0
CRL (087H) (R/W)	CR3	CR2	CR1	CR0
CRH (088H) (R/W)	CR7	CR6	CR5	CR4

	bit 3	bit 2	bit 1	bit 0
DRL (089H) (R/W)	DR3	DR2	DR1	DR0
DRH (08AH) (R/W)	DR7	DR6	DR5	DR4

	bit 3	bit 2	bit 1	bit 0
ERL (08BH) (R/W)	ER3	ER2	ER1	ER0
ERH (08CH) (R/W)	ER7	ER6	ER5	ER4

	bit 3	bit 2	bit 1	bit 0
FRL (08DH) (R/W)	FR3	FR2	FR1	FR0
FRH (08EH) (R/W)	FR7	FR6	FR5	FR4

The multiplication and division calculation registers are used as follows.

[Multiplication]

DR•CR←CR × ER

CR (CRH, CRL): Holds the multiplicand. After multiplication, holds the low-order 8 bits of the result.

ER (ERH, ERL): Holds the multiplier. After multiplication, holds data.

DR (DRH, DRL): After execution, the high-order 8 bits of the result are stored.

If the result of multiplication cannot be stored in the low-order 8 bits (DR is not 0), the multiplication/division condition register (MDCR) OV flag is set to "1". When bit 0 (MULS) of MDCR is set to "1", multiplication starts, and the result is output to the appropriate registers five machine cycles later.

[Division]

DR•CR←DR•CR/ER

FR←DR•CR mod ER

DR (DRH, DRL): The high-order 8 bits of the number being divided are set here. After execution, this register holds the high-order 8 bits of the result.

CR (CRH, CRL): The low-order 8 bits of the number being divided are set here. After execution, this register holds the low-order 8 bits of the result.

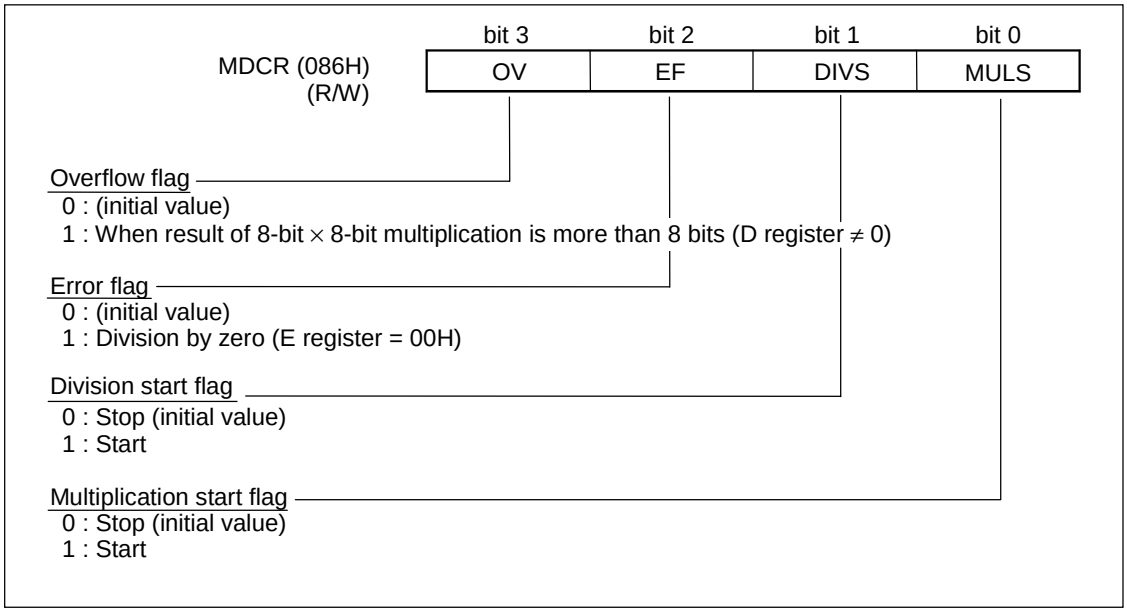
ER (ERH, ERL): The divisor is set here. After execution, this register holds data.

FR (FRH, FRL): After execution, this register holds the remainder.

If division is executed with ER = 00H (division by zero), the MDCR EF flag is set to "1". After division by zero the DC register value is 0FFFFH, and the pre-execution value from the C register is set to the F register. When bit 1 (DIVS) of MDCR is set to "1", division begins and the result is output to the appropriate registers ten machine cycles later.

16.2.2 Multiplication/Division Condition Register

The multiplication/division condition register (MDCR) is a 4-bit special function register (SFR) with a multiplication/division start flag and a status flag indicating the status of the operation when finished.



bit 3: OV (OVerflow flag)

Set to "1" when there is a carry (D register other than 00H) to the high-order 8 bits in multiplication, and otherwise cleared to "0".
This bit is initialized to "0" at system reset.

bit 2: EF (Error Flag)

Set to "1" when the E register is "0" in division, and otherwise cleared to "0".
This bit is initialized to "0" at system reset.

bit 1: DIVS (DIV Start)

Division is started when this bit is set to "1", and is completed in ten machine cycles. When division is complete DIVS is reset to "0".
This bit initializes to "0" at system reset.

bit 0: MULS (MUL Start)

This flag starts multiplication when set to "1", and multiplication is completed in five machine cycles. MULS is cleared to "0" when multiplication is completed.
This bit is reset to "0" at system reset.

16.3 Multiplication/Division Execution

Multiplication and division execution is handled as follows:

[Multiplication]

1. Multiplicand set to C register (CRH, CRL)
2. Multiplier set to E register (ERH, ERL)
3. MDCR MULS flag set to "1".

[Division]

1. High-order 8 bits of number being divided set to D register (DRH, DRL), and low-order 8 bits to C register (CRH, CRL).
2. Divisor set to E register (ERH, ERL).
3. MDCR DIVS flag set to "1".

Chapter 17

Battery Low Detect Circuit (BLD)

17. Battery Low Detect Circuit (BLD)

17.1 Overview

The ML63295A has an internal battery low detect circuit (BLD).

The battery low detect circuit detects when the battery voltage (supply voltage V_{DD}) falls below the judgment voltage value. Two levels of judgment voltage can be selected by the BLDCON bits.

Judgment voltage values (Ta = 25°C): 4.5 ±0.1 V, 5.1 ±0.1 V

Note:

When verifying BLD operation, the operation must be verified with an evaluation sample device.

17.2 Battery Low Detect Circuit Configuration

The battery low detect circuit consists of a judgment circuit and a judgment voltage select circuit. Figure 17-1 shows the circuit configuration.

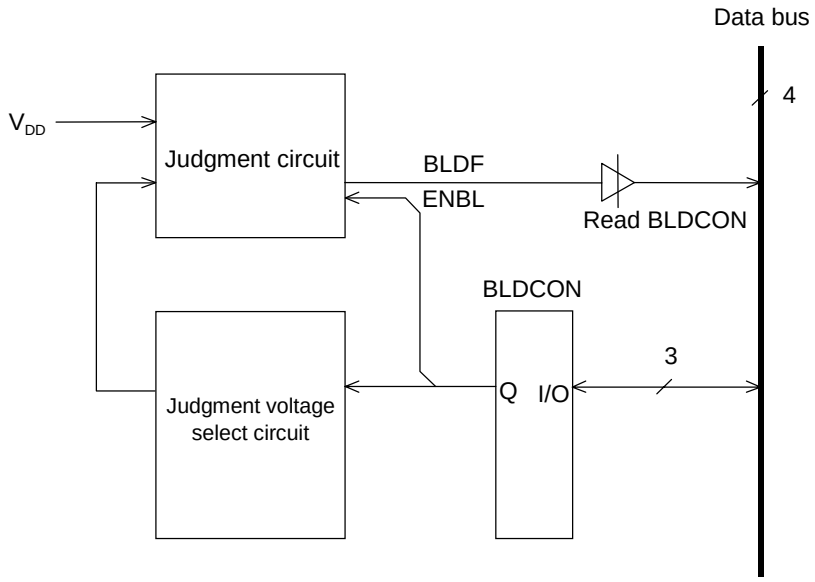


Figure 17-1 Battery Low Detect Circuit

17.3 Judgment Voltage

The value of the judgment voltage is selected by the software by setting the LD1 (bit 1 of BLDCON) and LD0 (bit 0 of BLDCON) bits.

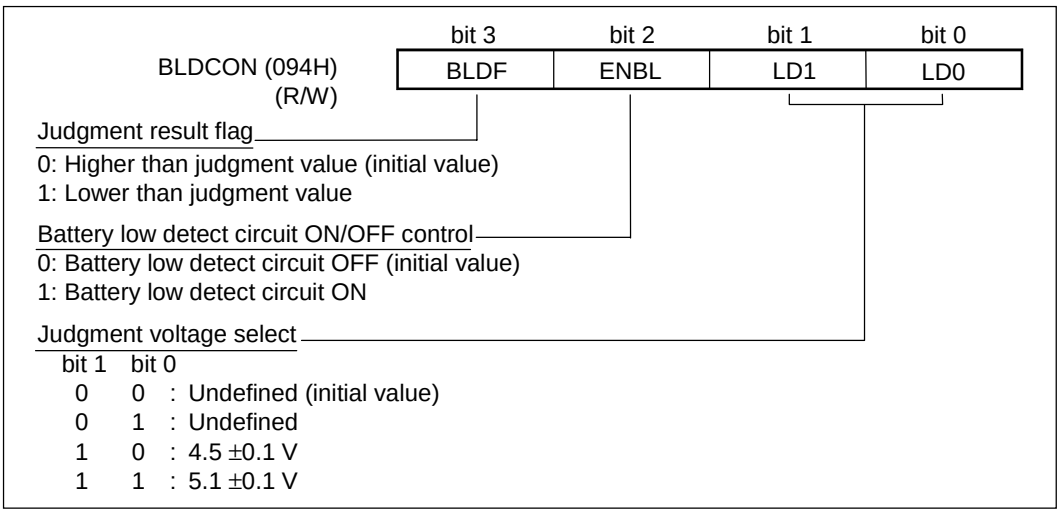
Table 17-1 lists judgment voltage and precision values.

Table 17-1 Judgment Voltage

LD1	LD0	Judgment voltage (V)	Precision (V)	Remarks
1	0	4.5	±0.1	Ta = 25°C
1	1	5.1	±0.1	Ta = 25°C

17.4 Battery Low Detect Circuit Register

- Battery low detect control register (BLDCON)
  BLDCON is a 4-bit special function register (SFR) that controls the battery low detect circuit.



bit 3: BLDF

This flag indicates the judgment result of the battery low detect circuit.
This bit is set to "1" when V_{DD} is lower than the judgment voltage selected by LD0 and LD1, and is set to "0" when V_{DD} is higher. This bit is "0" when the BLD circuit stops operation.
This bit is read-only and writes are invalid.

bit 2: ENBL

This bit turns the battery low detect circuit ON or OFF.
When ENBL is set to "1", the battery low detect circuit is ON. When ENBL is set to "0", the battery low detect circuit is OFF.
At system reset, this bit is cleared to "0".

bit 1, 0: LD1, LD0

These bits select the judgment voltage.
At system reset, these bits are cleared to "0".

17.5 Battery Low Detect Circuit Operation

The battery low detect circuit is turned ON or OFF by ENBL (bit 2 of BLDCON), and outputs to BLDF (bit 3 of BLDCON) the result of a comparison with the judgment voltage.

ENBL is the enable control bit for the battery low detect circuit. Setting ENBL to "1" turns ON the battery low detect circuit. Setting ENBL to "0" turns OFF the battery low detect circuit and BLD current supply drops to zero.

BLDF is the judgment result flag. If BLDF is "1", the power supply voltage is lower than the judgment voltage. If BLDF is "0", the power supply voltage is higher than the judgment voltage. BLDF is valid when ENBL is "1".

The judgment circuit of the battery low detect circuit requires time to become stable. Therefore, after setting ENBL to "1", wait at least 1 ms before reading BLDF. No load should be applied to the power supply voltage during the detection.

Figure 17-2 shows an example operation timing.

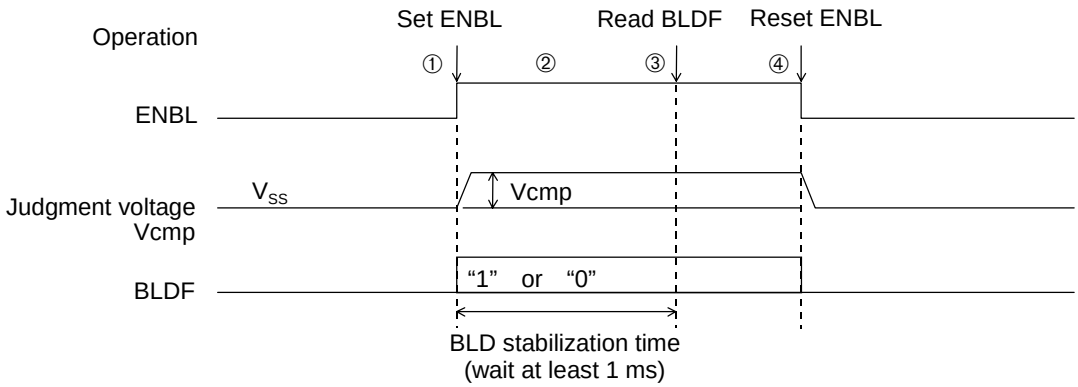


Figure 17-2 Operation Timing Example

Figure 17-2 shows the following operations.

① ENBL is set to "1" to turn ON the BLD.

② Operation starts with no load applied to power supply system and waits for BLD stabilization time interval (at least 1 ms).

③ Judgment result flag (BLDF) is read.

④ ENBL is cleared to "0".

Chapter 18

Power Supply Circuit (POWER)

18. Power Supply Circuit (POWER)

18.1 Overview

The ML63295A has incorporated in it a voltage regulator circuit for the internal logic power supply (V_{DDL}), a voltage regulator circuit for the low-speed oscillation circuit (V_{DDX1}), a circuit for generating bias reference voltages (V_{DDX4} and V_{DD3}), a resistor ladder circuit for generating bias voltages (V_{DD1}, V_{DD2}, V_{DD4}, V_{DD5}, and V_{DD6}), and a voltage regulator circuit for an external power supply (V_{DDE}).

Power supply voltage range: 3.5 to 7.2 V

18.2 Power Supply Circuit Configuration

Figure 18-1 shows the configuration of the power supply circuit.

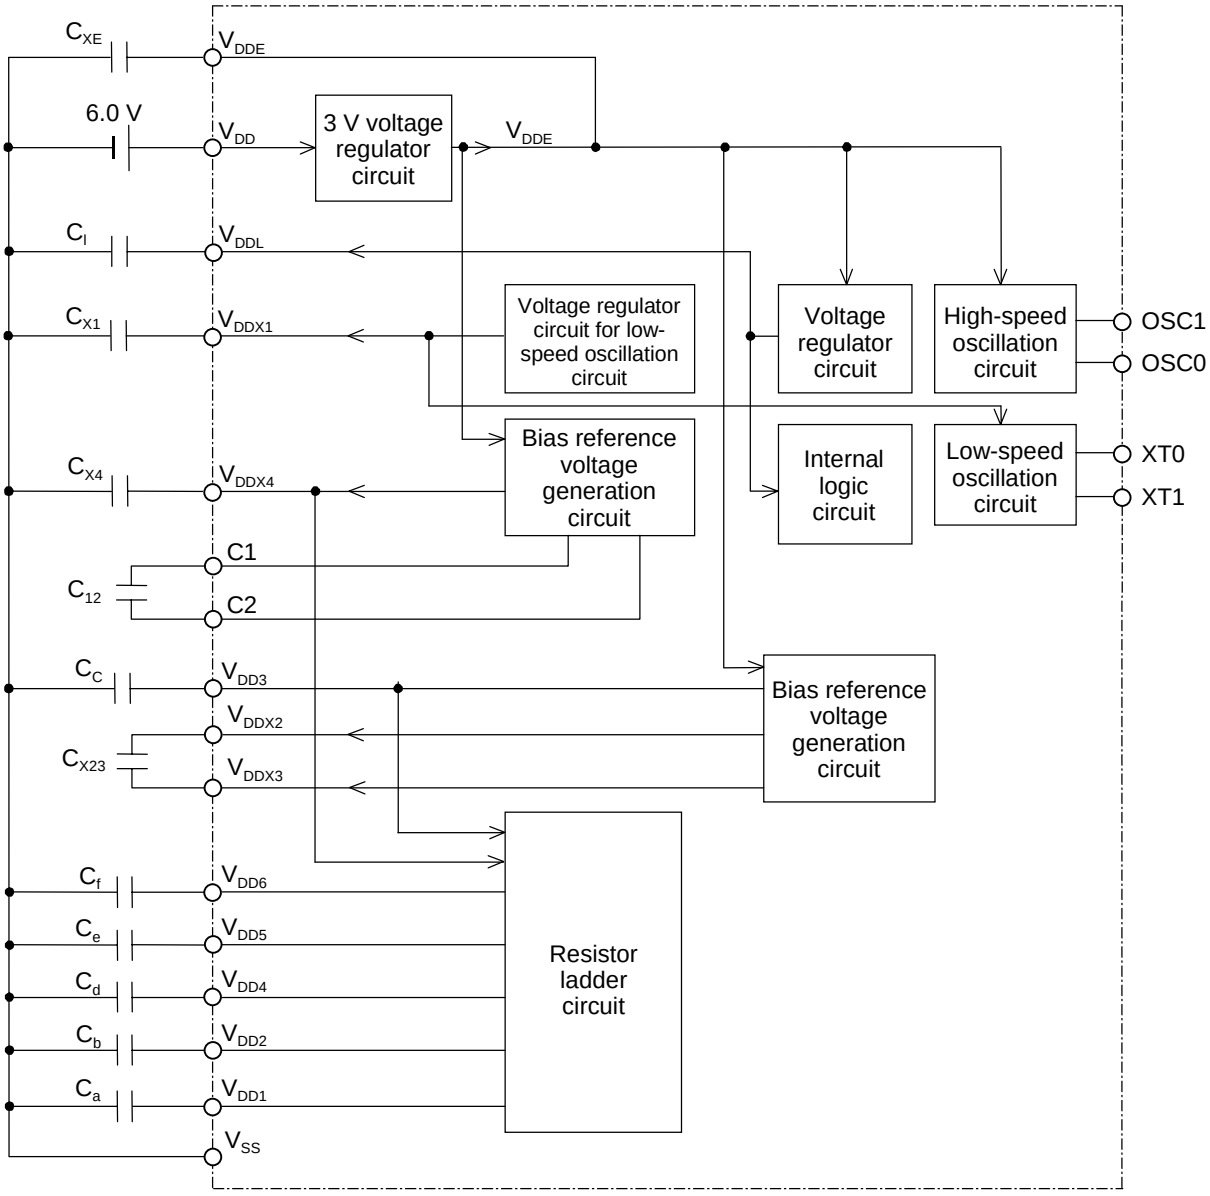

Figure 18-1 Power Supply Circuit Configuration (Power Supply Voltage = 6 V)

18.3 Power Supply Circuit Operation

The output of the internal logic power supply V_{DDL} is forcibly switched to the V_{DD} level when the time base counter is reset and goes down to 1.5 V immediately after the reset state is released. Further the V_{DDL} output goes up to the V_{DDE} level when ENOSC (bit 1 of FCON) is set to "1" and returns to about 1.5 V when ENOSC is set to "0".

The output of the power supply V_{DDX1} for the low-speed oscillation circuit is forcibly switched to the V_{DD} level when the time base counter is reset and goes down to about 1.5 V after the reset state is released.

The output of the external power supply V_{DDE} is forcibly switched to the V_{DD} level when the time base counter is reset and goes down to about 3 V after the reset state is released.

Figure 18-2 shows waveforms of the power supply circuit.

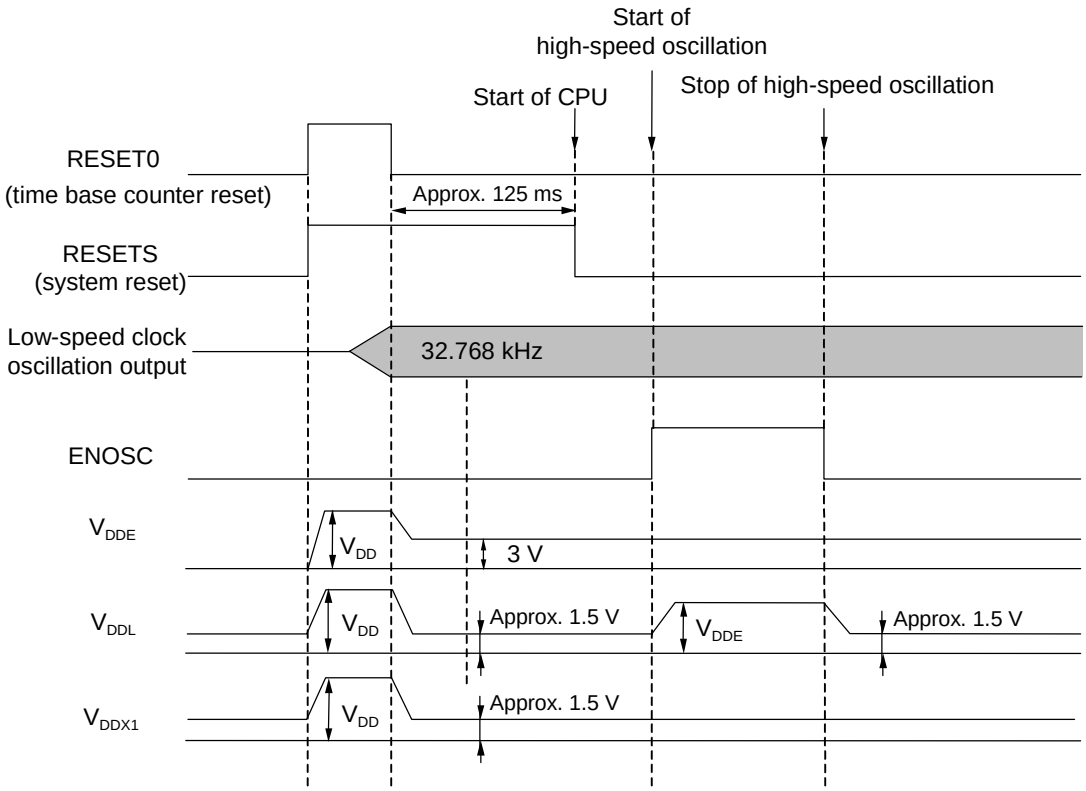

Figure 18-2 Power Supply Circuit Waveforms

Appendixes

Appendix A List of Special Function Registers

The Special Function Registers of the ML63295A are listed in Table A.

"—" indicates an invalid bit.

Table A Special Function Register List

Register name	Symbol	Address	bit 3	bit 2	bit 1	bit 0	R/W	Initial value at system reset
Port 0 data register	P0D	000H	P03	P02	P01	P00	R	Undefined
Port 1 data register	P1D	001H	P13	P12	P11	P10	R	Undefined
Port 2 data register	P2D	002H	P23	P22	P21	P20	R/W	0H
Port 3 data register	P3D	003H	P33	P32	P31	P30	R/W	0H
Port 4 data register	P4D	004H	P43	P42	P41	P40	R/W	0H
Port 5 data register	P5D	005H	P53	P52	P51	P50	R/W	0H
Port 6 data register	P6D	006H	P63	P62	P61	P60	R/W	0H
Port 7 data register	P7D	007H	P73	P72	P71	P70	R/W	0H
Port 8 data register	P8D	008H	P83	P82	P81	P80	R/W	0H
Port 9 data register	P9D	009H	P93	P92	P91	P90	R/W	0H
Port A data register	PAD	00AH	PA3	PA2	PA1	PA0	R/W	0H
Port B data register	PBD	00BH	PB3	PB2	PB1	PB0	R/W	0H

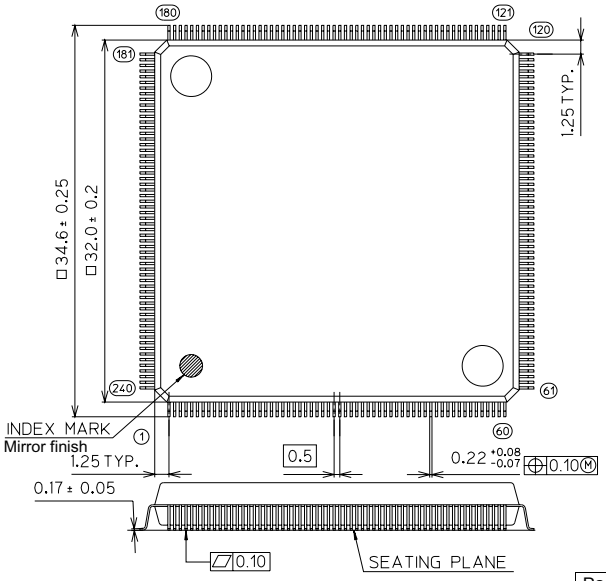
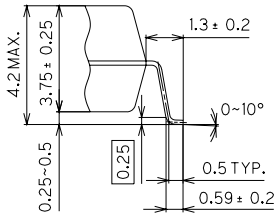
Appendix B Package Dimensions

ML63295A-xxxGA

(Unit: mm)

QFP240-P-3232-0.50-BK4





Package material	Epoxy resin
Lead frame material	Cu alloy
Pin treatment	Solder plating (≥5µm)
Package weight (g)	7.82 TYP.
Rev. No./Last Revised	2/Nov. 28, 1996

Oki Electric Industry Co., Ltd.

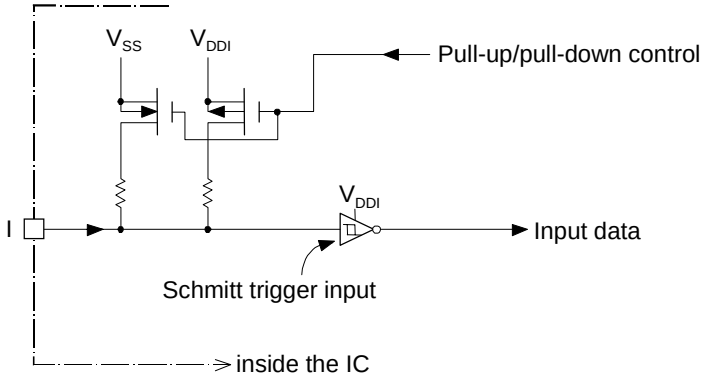
Figure B-1 240-Pin QFP (QFP240-P-3232-0.50-BK4)

Notes for Mounting the Surface Mount Type Package

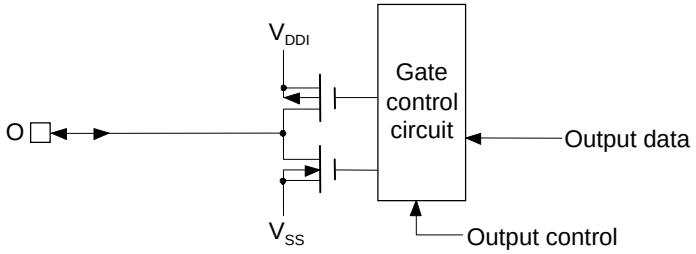
The surface mount type packages are very susceptible to heat in reflow mounting and humidity absorbed in storage. Therefore, before you perform reflow mounting, contact Oki's responsible sales person for the product name, package name, pin number, package code and desired mounting conditions (reflow method, temperature and times).

Appendix C Input/Output Circuit Configuration

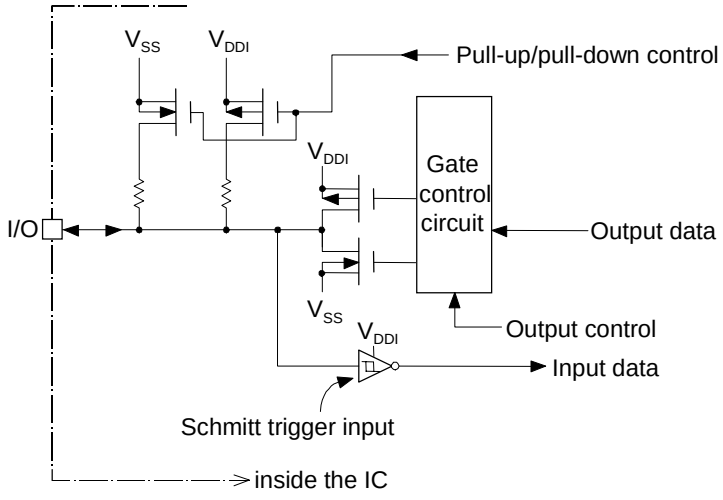
(1) Input Port (P0.0–P0.3, P1.0–P1.3)



(2) Output Port (P2.0–P2.3, P3.0–P3.3, P4.0–P4.3, P5.0–P5.3, P6.0–P6.3, P7.0–P7.3)

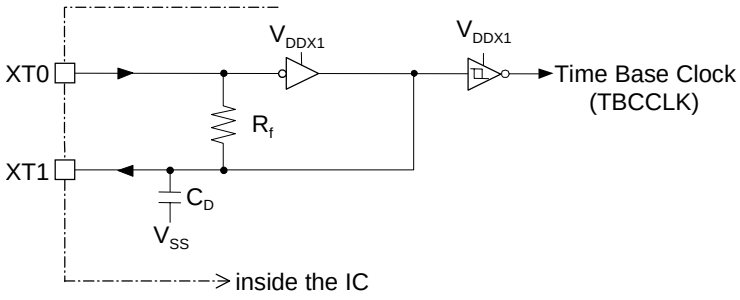


(3) I/O Port (P8.0–P8.3, P9.0–P9.3, PA.0–PA.3, PB.0–PB.3, PC.0–PC.3, PE.0–PE.3)

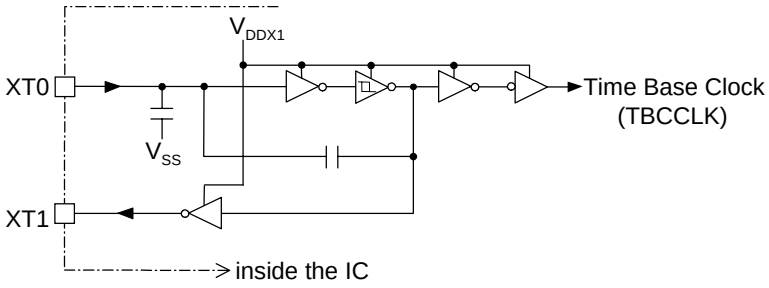


(4) Low-Speed Oscillation Circuit

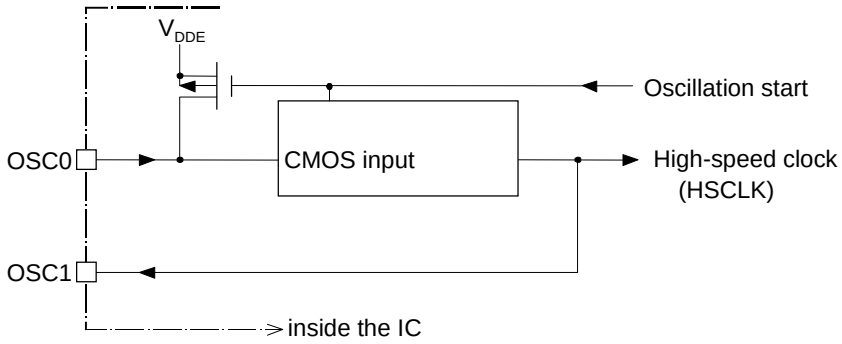
Crystal oscillation mode



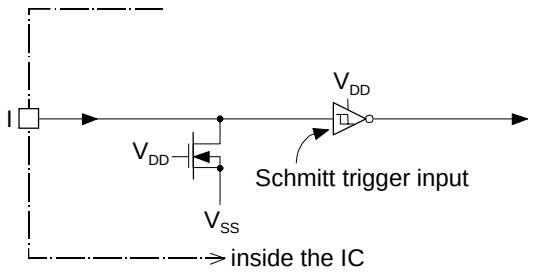
RC oscillation mode



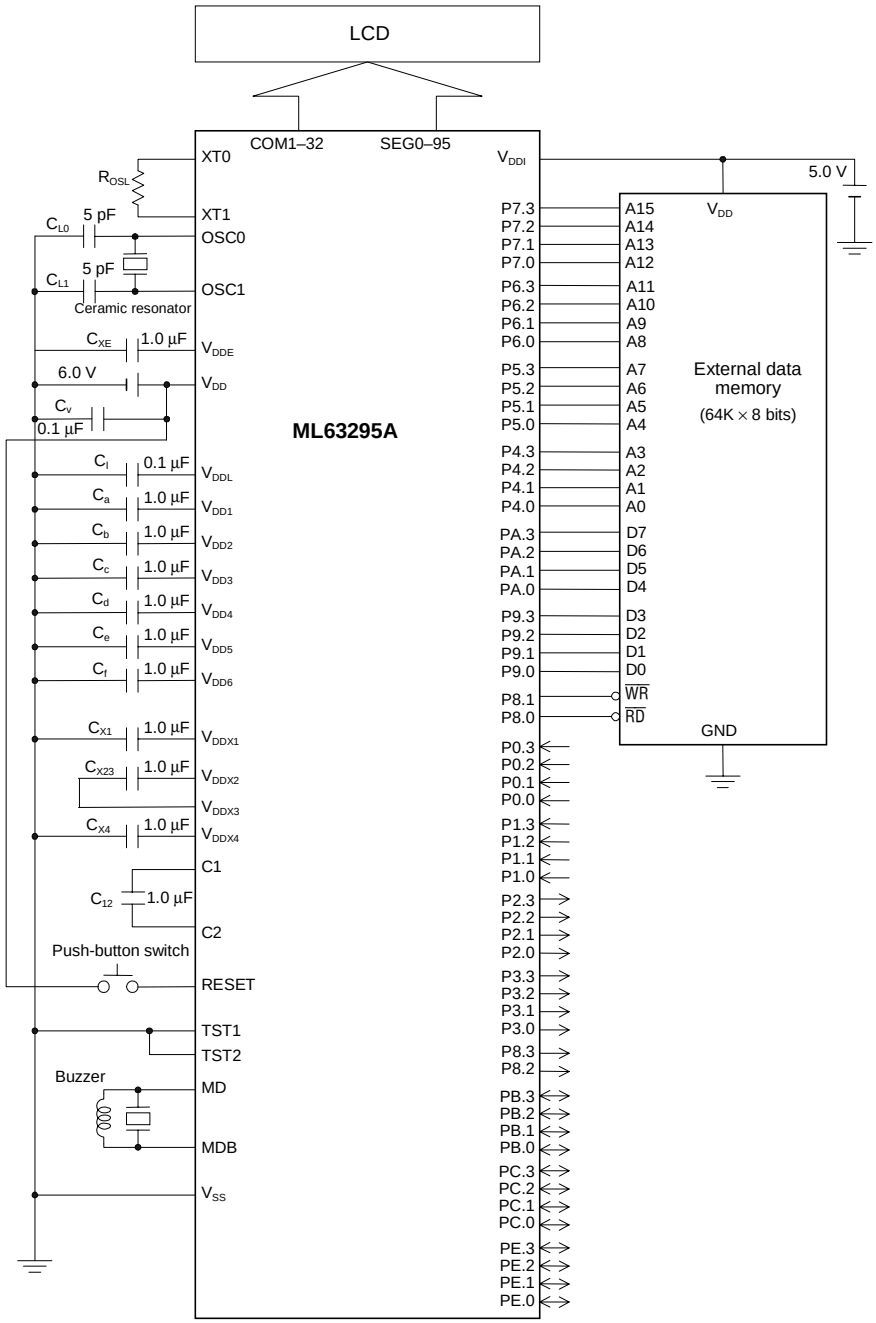
(5) High-Speed Oscillation Circuit



(6) RESET, TST1, and TST2 Inputs



Appendix D Peripheral Circuit Example



- RC oscillation is selected by mask option for low-speed oscillation.
- The power supply for the ports is shared with V_{DD}.
- C_V is an IC power supply bypass capacitor.
- Capacitance values for C_a, C_b, C_c, C_d, C_e, C_f, C_X, C_{X23}, C_{X4}, C_{12}, C_l, C_{XE}, C_{L0} and C_{L1} are only for reference.

Figure D-1 Peripheral Circuit Example

Note:

V_{DDI} is the power supply pin for input, output and I/O ports.
V_{DDI} must be connected to the positive power supply pin (V_{DD}) of the chip or the power supply pin of the external equipment.

Appendix E Electrical Characteristics

Absolute Maximum Ratings

(V_{SS} = 0 V)

Parameter	Symbol	Condition	Rating	Unit
Power Supply Voltage 1	V_{DD1}	Ta = 25°C	–0.3 to +1.5	V
Power Supply Voltage 2	V_{DD2}	Ta = 25°C	–0.3 to +2.5	V
Power Supply Voltage 3	V_{DD3}	Ta = 25°C	–0.3 to +6.5	V
Power Supply Voltage 4	V_{DD4}	Ta = 25°C	–0.3 to +4.5	V
Power Supply Voltage 5	V_{DD5}	Ta = 25°C	–0.3 to +5.5	V
Power Supply Voltage 6	V_{DD6}	Ta = 25°C	–0.3 to +6.5	V
Power Supply Voltage 7	V_{DDX1}	Ta = 25°C	–0.3 to +2.0	V
Power Supply Voltage 8	V_{DDX4}	Ta = 25°C	–0.3 to +6.5	V
Power Supply Voltage 9	V_{DD}	Ta = 25°C	–0.3 to +7.5	V
Power Supply Voltage 10	V_{DDI}	Ta = 25°C	–0.3 to +6.0	V
Power Supply Voltage 11	V_{DDL}	Ta = 25°C	–0.3 to +6.0	V
Power Supply Voltage 12	V_{DDE}	Ta = 25°C	–0.3 to +6.0	V
Input Voltage 1	V_{IN1}	V_{DD} input, Ta = 25°C	–0.3 to V_{DD} + 0.3	V
Input Voltage 2	V_{IN2}	V_{DDI} input, Ta = 25°C	–0.3 to V_{DDI} + 0.3	V
Output Voltage 1	V_{OUT1}	V_{DD1} output, Ta = 25°C	–0.3 to V_{DD1} + 0.3	V
Output Voltage 2	V_{OUT2}	V_{DD2} output, Ta = 25°C	–0.3 to V_{DD2} + 0.3	V
Output Voltage 3	V_{OUT3}	V_{DD3} output, Ta = 25°C	–0.3 to V_{DD3} + 0.3	V
Output Voltage 4	V_{OUT4}	V_{DD4} output, Ta = 25°C	–0.3 to V_{DD4} + 0.3	V
Output Voltage 5	V_{OUT5}	V_{DD5} output, Ta = 25°C	–0.3 to V_{DD5} + 0.3	V
Output Voltage 6	V_{OUT6}	V_{DD6} output, Ta = 25°C	–0.3 to V_{DD6} + 0.3	V
Output Voltage 7	V_{OUT7}	V_{DDX1} output, Ta = 25°C	–0.3 to V_{DDX1} + 0.3	V
Output Voltage 8	V_{OUT8}	V_{DDX4} output, Ta = 25°C	–0.3 to V_{DDX4} + 0.3	V
Output Voltage 9	V_{OUT11}	V_{DD} output, Ta = 25°C	–0.3 to V_{DD} + 0.3	V
Output Voltage 10	V_{OUT12}	V_{DDI} output, Ta = 25°C	–0.3 to V_{DDI} + 0.3	V
Output Voltage 11	V_{OUT13}	V_{DDE} output, Ta = 25°C	–0.3 to V_{DDE} + 0.3	V
Storage Temperature	T_{STG}	—	–55 to +150	°C

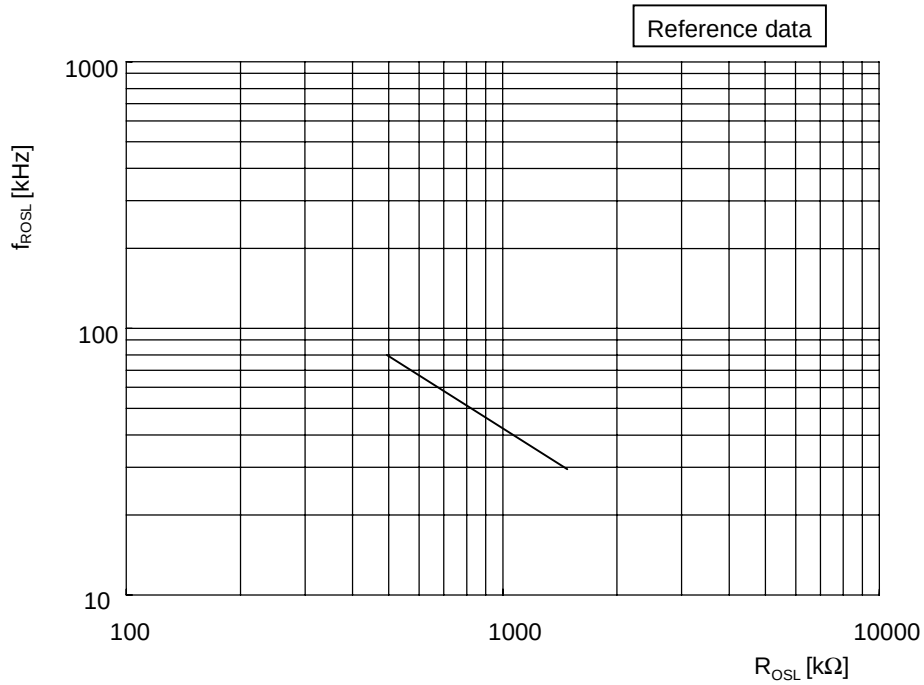
Recommended Operating Conditions

(V_{SS} = 0 V)

Parameter	Symbol	Condition		Range	Unit
Operating Temperature	T_{OP}	—		–20 to +70	°C
Operating Voltage	V_{DD}	—		3.5 to 7.2	V
	V_{DDI}	—		1.8 to 5.5	V
Crystal Oscillation Frequency	f_{XT}	C_G = 5 to 25 pF		32.768 to 76.8	kHz
Low-Speed RC Oscillation Frequency	f_{ROSL}	R_{OSL} = 1.5 MΩ		32k ±30%	Hz
		R_{OSL} = 700 kΩ		60k ±30%	
		R_{OSL} = 500 kΩ		80k ±30%	
Ceramic Oscillation Frequency	f_{CM}	V_{DD} = 3.5 to 7.2 V		200k to 2M	Hz
High-Speed RC Oscillation Frequency	f_{ROSH}	V_{DD} = 3.5 to 7.2 V	R_{OSH} = 100 kΩ	700k ±30%	Hz
			R_{OSH} = 75 kΩ	1M ±30%	
			R_{OSH} = 51 kΩ	1.35M ±30%	
			R_{OSH} = 30 kΩ	2M ±30%	

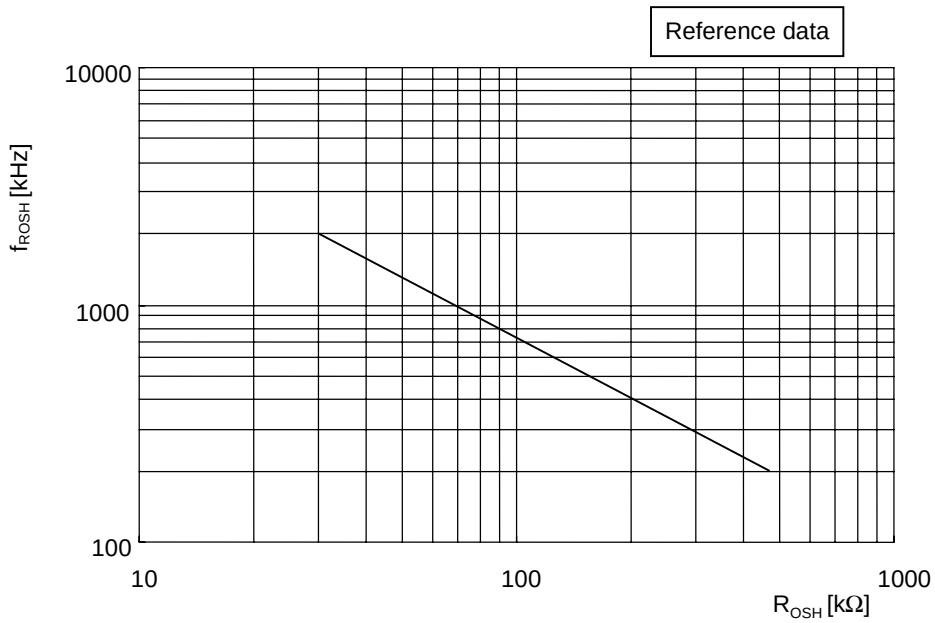
- Typical characteristics of low-speed RC oscillation

(V_{DD} = 6.0 V, V_{DDI} = 3.0 V)



- Typical characteristics of high-speed RC oscillation

(V_{DD} = 6.0 V, V_{DDI} = 3.0 V)



DC Characteristics

(V_{DD} = 3.5 to 7.2 V, V_{DDI} = 1.8 to 5.5 V, V_{SS} = 0 V, Ta = –20 to +70°C unless otherwise specified)

Parameter	Symbol	Condition	Min.	Typ.	Max.	Unit	Measuring Circuit
V_{DDE} Voltage	V_{DDE}	I_{OUT} = 0 to 15 mA, Ta = 25°C	2.7	3.0	3.3	V	1
V_{DDE} Voltage Temperature Deviation	ΔV_{DDE}	—	—	–4.0	—	mV/°C	
V_{DDL} Voltage	V_{DDL}	High-speed clock oscillation stopped	1.0	1.5	2.0	V	
		During operation at high-speed clock oscillation (V_{DD} = 3.5 to 7.2 V)	1.2	—	3.3		
Crystal Oscillation Start Voltage	V_{STA}	Oscillation start time: within 5 seconds	3.5	—	—		
Crystal Oscillation Hold Voltage	V_{HOLD}	—	3.5	—	—		
Crystal Oscillation Stop Detect Time	T_{STOP}	—	0.1	—	5.0	ms	
External Crystal Oscillator Capacitance	C_G	—	5	—	25	pF	
Internal Crystal Oscillator Capacitance	C_D	—	20	25	30		
External Ceramic Oscillator Capacitance	C_{L0}, C_{L1}	CSA2.00MG (Murata MFG.-make) used V_{DDE} = 3.0 V	—	30	—		
Internal RC Oscillator Capacitance	C_{OS}	—	8	12	16		
POR Voltage	V_{POR1}	V_{DD} = 6.0 V	0	—	0.7	V	
Non-POR Voltage	V_{POR2}	V_{DD} = 6.0 V	2.0	—	6.0		
BLD Judgment Voltage	V_{BLDC}	LD1 = 1, LD0 = 1, Ta = 25°C	5.00	5.10	5.20	V	—
		LD1 = 1, LD0 = 0, Ta = 25°C	4.40	4.50	4.60		
BLD Judgment Voltage Temperature Deviation	ΔV_{BLDC}	V_{BLDC} = 5.10 V (LD1 = 1, LD0 = 1)	—	–3.5	—	mV/°C	
		V_{BLDC} = 4.50 V (LD1 = 1, LD0 = 0)	—	–2.3	—		

Notes: 1. "T_{STOP}" indicates that if the crystal oscillator stops over the value of T_{STOP}, the system reset occurs.
2. "POR" denotes Power On Reset.
3. "V_{POR1}" indicates that POR occurs when V_{DD} falls from V_{DD} to V_{POR1} and again rises up to V_{DD}
4. "V_{POR2}" indicates that POR does not occur when V_{DD} falls from V_{DD} to V_{POR2} and again rises up to V_{DD}.

DC Characteristics (continued)

(V_{DD} = 6.0 V, V_{DDI} = 3.0 V, V_{SS} = 0 V, 1/6 bias, DSPCNT = 0H, Ta = –20 to +70°C unless otherwise specified)

Parameter	Symbol	Condition		Min.	Typ.	Max.	Unit	Measuring Circuit
Supply Current 1	I_{DD1}	CPU in HALT state, LCD is being driven, no panel load (Crystal oscillation: 32.768 kHz) (High-speed clock oscillation stopped)	Ta = –20 to +50°C	—	11.0	14.5	µA	1
			Ta = –20 to +70°C	—	11.0	19.5		
		CPU in HALT state, LCD is being driven, no panel load (RC oscillation: R_{OSL} = 1.5 MΩ) (High-speed clock oscillation stopped)	Ta = –20 to +50°C	—	14.5	18.0		
			Ta = –20 to +70°C	—	14.5	23.0		
Supply Current 2	I_{DD2}	CPU in HALT state, LCD in Power Down mode (Crystal oscillation: 32.768 kHz) (High-speed clock oscillation stopped)	Ta = –20 to +50°C	—	4.0	5.0		
			Ta = –20 to +70°C	—	4.0	6.5		
		CPU in HALT state, LCD in Power Down mode (RC oscillation: R_{OSL} = 1.5 MΩ) (High-speed clock oscillation stopped)	Ta = –20 to +50°C	—	7.0	8.0		
			Ta = –20 to +70°C	—	7.0	9.5

Appendix G Mask Option

The ML63295A can select the crystal oscillation circuit or the RC oscillation circuit as the oscillation circuit of the low-speed clock generator circuit by mask option.

To use the mask option, assign mask option data in the application program in accordance with the format below.

Assignment of the mask option data does not affect the application program execution area, because the areas for data assignment for each device are out of the program memory area.

- Data assignment area for ML63295A: address 7FE0H

ML63295A Mask Option Data Assignment Format

Address	Function	Contents	Data	
7FE0H	Low-speed oscillation clock	Crystal oscillation/ RC oscillation	0: Crystal oscillation	1: RC oscillation

Example of mask option data generation

- When the RC oscillation circuit is specified for the low-speed clock oscillation circuit in the ML63295A

```
ORG     7FE0H   ← Use an assembler pseudo-instruction to set the address of option data to 7FE0H.
DW      0001H   :  Low-speed oscillation clock, RC oscillation
```
