

# ACD2203

CATV/TV/Video Downconverter  
with Dual Synthesizer

PRELIMINARY DATA SHEET - Rev 1.3

## FEATURES

- Integrated Downconverter
- Integrated Dual Synthesizer
- 256 QAM Compatibility
- Single +5 V Power Supply Operation
- Low Power Consumption: <0.6 W
- Low Noise Figure: 8 dB
- High Conversion Gain: 10 dB
- Low Distortion: -53 dBc
- Two-Wire Interface
- Small Size
- -40 °C to +85 °C

## APPLICATIONS

- Set Top Boxes
- CATV Video Tuners
- Digital TV Tuners
- CATV Data Tuners
- Cable Modems

## PRODUCT DESCRIPTION

The ACD2203 uses both GaAs and Si technology to provide the downconverter and dual synthesizer functions in a double conversion tuner gain block, local oscillator, balanced mixer and dual synthesizer. The specifications meet the requirements of CATV/TV/Video and Cable Modem Data applications. The ACD2203 is supplied in a 28 lead SSOP package and requires a single +5 V supply voltage.

The IC is well suited for applications where small size, low cost, low auxiliary parts count and a no-compromise performance is important. It provides for cost reduction by lowering the component and packaged IC count and decreasing the amount of labor-intensive production alignment steps, while significantly improving performance and reliability.

**ELECTRICAL CHARACTERISTICS****Table 2: Absolute Minimum and Maximum Ratings**

PARAMETER	MIN	MAX	UNIT
Supply Voltage (pins 25, 27 & 28) (pin 15)	-	+9 +6.5	VDC
Voltage on pins 10 through 14, 16 through 19 with $V_{SS} = 0$ V	-0.3	$V_{SYN} + 0.3$	VDC
Input Voltages (pins 1, 2 & 5)	-	0	VDC
Input Power (pins 1 & 2) (pin 5) (pins 13, 16 & 19)	-	+10 +17 +20	dBm
Storage Temperature	-55	+150	°C
Soldering Temperature	-	260	°C
Soldering Time	-	4	Sec
Thermal Impedance, $\theta_{JC}$	-	40	°C/W

Stresses in excess of the absolute ratings may cause permanent damage. Functional operation is not implied under these conditions. Exposure to absolute ratings for extended periods of time may adversely affect reliability.

**Table 3: Operating Ranges**

PARAMETER	MIN	TYP	MAX	UNIT
Downconverter Frequencies <sup>(1)</sup> RF Input (RF) IF Output (IF) Local Oscillator (LO)	900 35 865	- - -	1200 150 1350	MHz
Synthesizer Frequencies Upconverter Synthesizer ( $RF_U$ ) Downconverter Synthesizer ( $RF_D$ ) Reference Oscillator ( $REF_N$ ) Phase Detector	400 400 2 -	- - 4 -	2100 1400 20 10	MHz
Supply Voltage: $V_{DD}$ (pins 15, 25, 27, 28)	+4.70	+5	+5.25	VDC
Ambient Operating Temperature: $T_A$ <sup>(2)</sup>	-40	-	+85	°C

The device may be operated safely over these conditions; however, parametric performance is guaranteed only over the conditions defined in the electrical specifications.

Notes:

- (1) Mixer operation is possible beyond these frequencies with slightly reduced performance.
- (2) Case Temperature is 15 °C higher than Ambient Temperature, when Ambient Temperature is +25 °C, using the PC Board Layout shown in Figures 24-26.

**Table 4: Electrical Specifications - Downconverter Section**  
 ( $T_A = +25\text{ }^\circ\text{C}$  <sup>(7)</sup>,  $V_{DD} = +5\text{ VDC}$ ,  $R_{F_{IN}} = 1087\text{ MHz}$ ,  $I_{F_{OUT}} = 45\text{ MHz}$ )

## LOGIC PROGRAMMING

The ACD2203 includes an interface for a two-wire serial data control bus that ANADIGICS has developed for use with its dual PLL synthesizers. This interface saves one connection between the host and the dual synthesizer, compared to a standard CLOCK-DATA-ENABLE three-wire interface. The interface is optimized for applications in which the dual synthesizer is a slave receiver device. Hosts that conform to the I<sup>2</sup>C-Bus Specification standard can be used to program a dual PLL that uses this interface.

### Physical Interface

The two-wire interface consists of two digital signal lines, CLOCK and DATA. The speed of the interface is nominally 400 kbits/sec. For data transmission, the signal on the DATA line must be stable when the CLOCK signal is high, and the state of the data must change only while the CLOCK signal is low. A logic level transition on the DATA line during a high CLOCK signal indicates the beginning or end of a data transmission, as specified in the following sections and shown in Figure 21.

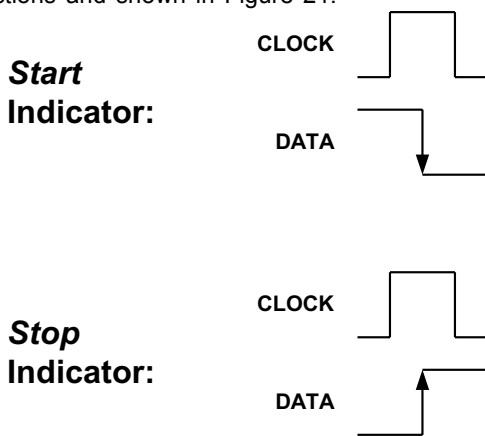

Figure 21: Transmission Indicators

### Addressing The Dual PLL

The dual PLL monitors the CLOCK and DATA signals for a *Start* indication from the host. A *Start* is indicated by a high-to-low transition of the DATA signal while the CLOCK signal is high. Immediately following the *Start* indicator, the host sends an 8-bit address word to the dual PLL. The 8-bit word required to address the dual PLL is programmable via a DC voltage level applied to the address select pin. For example, a voltage of  $4V < AS < 5V$  corresponds to a value of C6h, or 1100110b. (The MSB is sent first, LSB last.) The Address Select pin

(10) decodes an analog voltage input into two digital logic output bits AS1 and AS2. The level of a DC voltage applied to this pin determines the two-bit logic state, AS2 and AS1 to address the synthesizer. The software must be programmed with the corresponding decimal equivalent of the 8b word selected, as shown in Table 7. Once the dual PLL has recognized the *Start* indicator and the correct address word, it sends an address acknowledgement to the host by pulling the DATA line low for one clock pulse. The host can then begin to send data to program the dual PLL.

### Sending Data

After receiving the address byte acknowledgement from the dual PLL, the host begins sending programming data in 8-bit words. The MSB is sent first, and the LSB last. Following the receipt of each 8-bit data word, the dual PLL acknowledges receipt by pulling the DATA line low for one clock pulse. The data acknowledgement tells the host it may send the next data word. For the dual PLL, each group of three data words (24 bits total) is a significant block of information used to program one of four registers, as described in "Programming the Dual PLL."

### Completing Data Transmissions

After sending the final data word, the host sends a *Stop* indicator to mark the end of data transmission. A *Stop* is indicated by a low-to-high transition of the DATA signal while the CLOCK signal is held high. After receiving the *Stop* indicator, the dual PLL ceases to send further acknowledgements and begins to monitor the CLOCK and DATA signals for the next *Start* indicator.

*Note: The Stop indicator does not directly control when the programming data is latched or takes effect; the data takes effect immediately following the receipt of each three-word block of data, which represents a complete 24-bit divider register.*

### Resending Data

If, for some reason, the data transmission fails or is interrupted, and the dual PLL fails to send an address word or data word acknowledgement to the host, the host can resend the data. To resend data, a new *Start* indicator and address word must be sent prior to any data words.

### Programming The Dual PLL

Each synthesizer in the dual PLL contains programmable Reference and Main dividers, which

**Table 7: Address Select Decoding**  
(T<sub>A</sub> = +25 °C <sup>(1)</sup>, V<sub>DD</sub> = +5 VDC)

VOLTAGE ON PIN 10, AS	C (BINARY 12)				AS2 AS1				HEX	DECIMAL
	B7	B6	B5	B4	B3	B2	B1	B0		
V <sub>SS</sub> < AS < 0.8V	1	1	0	0	0	0	1	0	C2	194
1.1V < AS < 1.7V	1	1	0	0	0	0	0	0	C0	192
2.1V < AS < 2.7V	1	1	0	0	0	1	0	0	C4	196
3.15V < AS < 3.65V	1	1	0	0	0	0	0	0	C0	192
4.2V < AS < V <sub>DD</sub>	1	1	0	0	0	1	1	0	C6	198

Notes:

(1) Case Temperature is 15 °C higher than Ambient Temperature, when Ambient Temperature is +25 °C, using the PC Board Layout shown in Figures 24-26.

allow a wide range of output frequencies. The 24-bit registers that control the dividers and other functions are each segmented into three 8-bit data words, and are programmed via the two-wire interface.

**Register Select Bits**

The two least significant bits of each register are register select bits that determine which register is programmed during a particular data entry cycle. Table 8 indicates the register select bit settings used to program each of the available registers.

**Table 8: Register Select Bits**

SELECT BITS		DESTINATION REGISTER FOR SERIAL DATA
S 2	S 1	
0	0	Reference Divider Register for PLL2
0	1	Main Divider Register for PLL2
1	0	Reference Divider Register for PLL1
1	1	Main Divider Register for PLL1

**Reference Divider Programming**

The reference divider register for each synthesizer consists of fifteen divider bits, five program mode bits and the two register select bits, as shown in Table 9. The fifteen divider bits allow a divide ratio from 3 to 32767, inclusive, as shown in Table 10.

**Main Divider Programming**

The main divider register for each synthesizer consists of seven A counter bits, eleven B counter bits, two program mode bits and the two register select bits, as shown in Table 11. The main divider divide ratio, N, is determined by the values in the A and B counters. The eleven B Counter bits and allowed values are shown in Table 12, and the seven A Counter bits and allowed values are shown in Table 13. Note that there are some limitations on the ranges of the values for each counter.

**Pulse Swallow Function**

The VCO output frequency for the local oscillator is computed using the following equation; the variables are defined in Table 14:

$$f_{vco} = N \times f_{osc}/R, \text{ where } N = [(P \times B) + A]$$

where:

$$N = [(P \times B) + A]$$

f<sub>vco</sub> is the desired output frequency

B is the divide ratio of the B counter (3 to 2047)

A is the divide ratio of the A counter (0<A<P, A<B)

f<sub>osc</sub> is the frequency of the reference oscillator

R is the divide ratio of the R counter (3 to 32767)

P is the preset modulus of the prescaler (P=64).

**Table 9: Reference Divider Registers**

		MSB																LSB

 $B > A, A < P$

**Table 14: Phase Detector Polarity Bit**

S 2	S 1	D 1
0	0	PLL2 Phase Detector Polarity
1	0	PLL1 Phase Detector Polarity

**Programmable Modes**

Each register contains bits set aside for programming different modes of operation in the synthesizers. Bit D1 in each reference divider register controls the phase detector polarity. Table 14 shows how this bit controls the polarity, and the correct setting is determined by using Table 15 and Figure 22.

**Table 15: Phase Detector Polarity Selection**

D 1	POLARITY	VCO CHARACTERISTICS
0	Negative	curve (2)
1	Positive	curve (1)

**Figure 22: VCO Characteristics**

Bit C1 in each main divider register sets the prescalar mode. Table 16 indicates the appropriate settings. (Currently, there is only one prescalar mode available for use.)

**Table 16: Prescalar Mode**

C 1	PRESCALAR MODE
0	64/65
1	(reserved for future use)

Bit C2 in the main divider registers, bits D2 through D5 in the reference divider registers, and bits X1 and X2 in all registers are reserved for future use, and have no current function. They can be set either high or low without affecting synthesizer performance.

**Synthesizer Programming Example**

The following example for programming the two synthesizers in the dual PLL details the calculations used to determine the required value of each bit in all four registers:

**Requirements**

Desired CATV input channel: "HHH" - 499.25 MHz picture carrier (501 MHz digital channel center frequency)

(Second) IF picture carrier output frequency: 45.75 MHz (44 MHz digital channel center frequency)

First IF frequency: 1087.75 MHz (recommended)

Phase detector comparison frequency for down converter (also tuning increment): 62.5 KHz

Phase detector comparison frequency for up converter: 250 KHz

Crystal reference oscillator frequency: 4 MHz

**Calculation of Reference Divider Values**

The value for each reference divider is calculated by dividing the reference oscillator frequency by the desired phase detector comparison frequency:

$$R = f_{OSC} / f_{PD}$$

For the down converter, the 4 MHz crystal oscillator frequency and the 62.5 KHz phase detector comparison frequency are used to yield  $R_{PLL2} = 4 \text{ MHz} / 62.5 \text{ KHz} = 64$ , and so the bit values for the down converter R counter are  $R_{PLL2} = 000000001000000$ .

For the up converter, the 4 MHz crystal oscillator frequency and the 250 KHz phase detector comparison frequency are used to yield  $R_{PLL1} = 4 \text{ MHz} / 250 \text{ KHz} = 16$ , and so the bit values for the up converter R counter are  $R_{PLL1} = 00000000010000$ .

**Calculation of Main Divider Values**

The values for the A and B counters are determined by the desired VCO output frequency for the local oscillator and the phase detector comparison frequency:

$$N = f_{VCO} / f_{PD}$$

$$B = \text{trunc}(N / P)$$

$$A = N - (B \times P)$$

The down converter local oscillator frequency will be 1087.75 MHz - 45.75 MHz = 1042 MHz in this example. The main divider ratio for the down converter, then, is  $N_{PLL2} = 1042 \text{ MHz} / 62.5 \text{ KHz} = 16672$ . Since  $P = 64$  in the ACD2203,  $B_{PLL2} = \text{trunc}(16672 / 64) = 260$ , and  $A_{PLL2} = 16672 - (260 \times 64) = 32$ . These results give bit values of  $B_{PLL2} = 00100000100$  and  $A_{PLL2} = 0100000$  for the B and A counters.

The up converter local oscillator frequency will be 499.25 MHz + 1087.75 MHz = 1587 MHz in this example. Therefore,  $N_{PLL1} = 1587 \text{ MHz} / 250 \text{ KHz} = 6348$ ,  $B_{PLL1} = \text{trunc}(6348 / 64) = 99$ , and  $A_{PLL1} = 6348 - (99 \times 64) = 12$ . These results give bit values of  $B_{PLL1} = 00001100011$  and  $A_{PLL1} = 0001100$  for the B and A counters.

**Phase Detector Polarity**

If the VCO for the up converter has a negative slope, the phase detector polarity for PLL1 should be negative, and  $D1_{PLL1} = 1$ . If the VCO for the down converter has a positive slope, the phase detector polarity for PLL2 should be positive, and  $D1_{PLL2} = 0$ .

In summary, for this example, the four register programming words are shown in Tables 17 and 18 on the following page.

**Table 17: PLL1 and PLL2 Reference Divider Register Bits  
for Synthesizer Programming Example**

		MSB																LSB

PACKAGE OUTLINE

NOTES:

1. CONTROLLING DIMENSION: INCHES
2. DIMENSION "D" DOES NOT INCLUDE MOLD FLASH, PROTRUSIONS OR GATE BURRS. MOLD FLASH, PROTRUSIONS AND GATE BURRS SHALL NOT EXCEED 0.006 [0.15mm] PER SIDE.
3. DIMENSION "E" DOES NOT INCLUDE INTER-LEAD FLASH OR PROTRUSIONS. INTER-LEAD FLASH AND PROTRUSIONS SHALL NOT EXCEED 0.010 [0.25mm] PER SIDE.
4. MAXIMUM LEAD TWIST/SKEW TO BE  $\pm 0.0035$  [0.089mm].
5. REFERENCE JEDEC MO-137 AF.

ANADIGICS products are not intended for use in life support appliances, devices, or systems. Use of an ANADIGICS product in any such application without written consent is prohibited.

SUNSTAR 商斯达实业集团是集研发、生产、工程、销售、代理经销、技术咨询、信息服务等为一体的高科技企业，是专业高科技电子产品生产厂家，是具有 10 多年历史的专业电子元器件供应商，是中国最早和最大的仓储式连锁规模经营大型综合电子零部件代理分销商之一，是一家专业代理和分销世界各大品牌 IC 芯片和电子元器件的连锁经营综合性国际公司，专业经营进口、国产名厂名牌电子元件，型号、种类齐全。在香港、北京、深圳、上海、西安、成都等全国主要电子市场设有直属分公司和产品展示展销窗口门市部专卖店及代理分销商，已在全国范围内建成强大统一的供货和代理分销网络。我们专业代理经销、开发生产电子元器件、集成电路、传感器、微波光电元器件、工控机/DOC/DOM 电子盘、专用电路、单片机开发、MCU/DSP/ARM/FPGA 软件硬件、二极管、三极管、模块等，是您可靠的一站式现货配套供应商、方案提供商、部件功能模块开发配套商。商斯达实业公司拥有庞大的资料库，有数位毕业于著名高校——有中国电子工业摇篮之称的西安电子科技大学（西军电）并长期从事国防尖端科技研究的高级工程师为您精挑细选、量身订做各种高科技电子元器件，并解决各种技术问题。

微波光电部专业代理经销高频、微波、光纤、光电元器件、组件、部件、模块、整机；电磁兼容元器件、材料、设备；微波 CAD、EDA 软件、开发测试仿真工具；微波、光纤仪器仪表。欢迎国外高科技微波、光纤厂商将优秀产品介绍到中国、共同开拓市场。长期大量现货专业批发高频、微波、卫星、光纤、电视、CATV 器件：晶振、VCO、连接器、PIN 开关、变容二极管、开关二极管、低噪晶体管、功率电阻及电容、放大器、功率管、MMIC、混频器、耦合器、功分器、振荡器、合成器、衰减器、滤波器、隔离器、环行器、移相器、调制解调器；光电子器件和组件：红外发射管、红外接收管、光电开关、光敏管、发光二极管和发光二极管组件、半导体激光二极管和激光器组件、光电探测器和光接收组件、光发射接收模块、光纤激光器和光放大器、光调制器、光开关、DWDM 用光发射和接收器件、用户接入系统光收发器件与模块、光纤连接器、光纤跳线/尾纤、光衰减器、光纤适配器、光隔离器、光耦合器、光环行器、光复用器/转换器；无线收发芯片和模组、蓝牙芯片和模组。
