

Agilent HCPL-3100/HCPL-3101 Power MOSFET/IGBT Gate Drive Optocouplers Data Sheet

Description

The HCPL-3100/3101 consists of an LED* optically coupled to an integrated circuit with a power output stage. These optocouplers are suited for driving power MOSFETs and IGBTs used in motor control inverter applications. The high operating voltage range of the output stage provides the voltage drives required by gate controlled devices. The voltage and current supplied by these optocouplers allow for direct interfacing to the power device without the need for an intermediate amplifier stage.

Recommended Protection for Output Transistors

During switching transitions, the output transistors Q1 and Q2 of the HCPL-3100/3101 can conduct large amounts of current. Figure 1 describes a recommended circuit design

showing a current limiting resistor R_2 which is necessary in order to prevent damage to the output transistors Q1 and Q2. (See Note 7.) A bypass capacitor C_1 is also recommended to reduce power supply noise.

*The Input-Output Momentary Withstand Voltage is a dielectric voltage rating that should not be interpreted as an input-output continuous voltage rating. For the continuous voltage rating refer to the IEC/EN/DIN EN 60747-5-2 Insulation Characteristics Table (if applicable), your equipment level safety specification, or Agilent Application Note 1074, "Optocoupler Input-Output Endurance Voltage."

Notes:

- Derate absolute maximum ratings with ambient temperatures as shown in Figures 11 and 12.
- A bypass capacitor of 0.01 μF or more is needed near the device between V_{CC} and GND when measuring output and transfer characteristics.
- I_{FLH} represents the forward current when the output goes from low to high.
- Device considered a two terminal device; pins 1-4 are shorted together and pins 5-8 are shorted together.
- For devices with minimum V_{ISO} specified at 5000 V rms, in accordance with UL 1577, each optocoupler is proof-tested by applying an insulation test voltage $\geq 6000 \text{ V rms}$ for one second (leakage current detection limit, $I_{I-O} \leq 200 \mu\text{A}$).
- The t_{PLH} and t_{PHL} propagation delays are measured from the 50% level of the input pulse to the 50% level of the output pulse.
- R_2 limits the Q1 and Q2 peak currents. For more applications and circuit design information see Application Note "Power Transistor Gate/Base Drive Optocouplers."
