

Product Description

The SGA-7489 is a high performance SiGe HBT MMIC Amplifier. A Darlington configuration featuring 1 micron emitters provides high F_T and excellent thermal performance. The heterojunction increases breakdown voltage and minimizes leakage current between junctions. Cancellation of emitter junction non-linearities results in higher suppression of intermodulation products. Only 2 DC-blocking capacitors, a bias resistor and an optional RF choke are required for operation.

The matte tin finish on Sirenza's lead-free package utilizes a post annealing process to mitigate tin whisker formation and is RoHS compliant per EU Directive 2002/95. This package is also manufactured with green molding compounds that contain no antimony trioxide nor halogenated fire retardants.

NOTE: The recommended operating current in the preliminary datasheet was 130mA. Supplemental measurements have since shown that an operating current of 115mA results in optimal RF performance over temperature. Continued operation at 130mA is reliable, however, the recommended operating current has been changed to 115mA.

Absolute Maximum Ratings

Parameter	Absolute Limit
Max. Device Current (I _D)	170 mA
Max. Device Voltage (V _D)	7 V
Max. RF Input Power : Z _L = 50 Ohms	+16 dBm
Max. RF Input Power : Load VSWR=10:1*	+2 dBm
Max. Junction Temp. (T _J)	+150°C
Operating Temp. Range (T _O)	-40°C to +85°C
Max. Storage Temp.	+150°C

Operation of this device beyond any one of these limits may cause permanent damage. For reliable continuous operation, the device voltage must not exceed 5.3V and the device current must not exceed 143mA.
 Bias Conditions should also satisfy the following expression:
 $I_D V_D < (T_J - T_J) / R_{TH} \text{ J-I}$

*Note: Take into account out of band load VSWR presented by devices such as SAW filters to determine maximum RF input power. Reflected harmonic levels in saturation are significant.

Mounting Instructions

1. Solder the copper pad on the backside of the device package to the ground plane.
2. Use a large ground pad area with many plated through-holes as shown.
3. We recommend 1 or 2 ounce copper. Measurement for this data sheet were made on a 31 mil thick FR-4 board with 1 ounce copper on both sides.

Pin #	Function	Description
1	RF IN	RF input pin. This pin requires the use of an external DC blocking capacitor chosen for the frequency of operation.
2, 4	GND	Connection to ground. For optimum RF performance, use via holes as close to ground leads as possible to reduce lead inductance.
3	RF OUT/BIAS	RF output and bias pin. DC voltage is present on this pin, therefore a DC blocking capacitor is necessary for proper operation.
