

Product Specification PE3512

Product Description

The PE3512 is a high-performance static UltraCMOS™ prescaler with a fixed divide ratio of 4. Its operating frequency range is DC to 1500 MHz. The PE3512 operates on a nominal 3 V supply and draws only 8 mA. The input and output interfaces support both AC-coupled, low-Z RF as well as direct connection to low voltage positive logic devices. It is packaged in a small 6-lead SC-70 and is ideal for frequency scaling solutions

The PE3512 is manufactured on Peregrine's UltraCMOS™ process, a patented variation of silicon-on-insulator (SOI) technology on a sapphire substrate, offering the performance of GaAs with the economy and integration of conventional CMOS.

1500 MHz Low Power UltraCMOS™ Divide-by-4 Prescaler

Features

- DC to 1500 MHz operation
- Fixed divide ratio of 4
- Low-power consumption: 8 mA typical @ 3V
- RF or LV Digital Interface
- Ultra-small package: 6-lead SC-70

Pin No.	Pin Name	Description
1	N/C	No Connect. This pin should be left open.
2	GND	Ground pin. Ground pattern on the board should be as wide as possible to reduce ground impedance.
3	IN	Input signal pin. DC blocking capacitor required (100 pF typical).
4	V _{DD}	Power supply pin. Bypassing is required.
5	GND	Ground pin.
6	OUT	Divided frequency output pin. DC blocking capacitor required (100 pF typical).

T _{ST}	Storage temperature range	-65	150	°C
T _{OP}	Operating temperature range	-40	85	°C
V _{ESD}	ESD voltage (Human Body Model)		2000	V

Absolute Maximum Ratings are those values listed in the above table. Exceeding these values may cause permanent device damage. Exposure to absolute maximum ratings for extended periods may affect device reliability.

Electrostatic Discharge (ESD) Precautions

When handling this UltraCMOS™ device, observe the same precautions that you would use with other ESD-sensitive devices. Although this device contains circuitry to protect it from damage due to ESD, precautions should be taken to avoid exceeding the rating specified in Table 6.

Latch-Up Avoidance

Unlike conventional CMOS devices, UltraCMOS™ devices are immune to latch-up.

Device Functional Considerations

The PE3512 divides an input signal, up to a frequency of 1500 MHz, by a factor of four thereby producing an output frequency at one-fourth the input frequency. To work properly with low impedance, ground referenced interfaces, the input and output signals (pins 3 & 6) must be AC coupled via an external capacitor, as shown in the test circuit in Figure 4.

The ground pattern on the board should be made as wide as possible to minimize ground impedance. See Figure 9 for a layout example.

Evaluation Kit

Evaluation Kit Operation

The SC-70 Prescaler Evaluation Board was designed to help customers evaluate the *PE3512* divide-by-4 prescaler. On this board, the device input (pin 3) is connected to connector J1 through a $50\ \Omega$ transmission line. A series capacitor (C1) provides the necessary DC block for the device input. A value of 100 pF was used for this board layout; other applications may require a different value.

The device output (pin 6) is connected to J3 through a $50\ \Omega$ transmission line. A series capacitor (C5) provides the necessary DC block for the device output. This capacitor value must be chosen to have a low impedance at the desired output frequency of the device. A value of 100 pF was chosen for the evaluation board. At both input and output, select a capacitor value that offers low series reactance while ensuring that any parasitic resonances are well above the operating bandwidth.

The board is constructed of a two-layer FR4 material with a total thickness of 0.031". The bottom layer provides ground for the RF transmission lines. The transmission lines were designed using a coplanar waveguide above ground plane model with trace width of 0.030", trace gaps of 0.007", dielectric thickness of 0.028", metal thickness of 0.0014", and ϵ_r of 4.4. Note that the predominate mode of these transmission lines is coplanar waveguide. Liberal numbers of plated through holes unite the top and

bottom ground areas for best performance.

J6 provides DC power to the device via pin 4. Two decoupling capacitors (100 pF, 1000 pF) are included on this trace. It is the customer's responsibility to determine proper supply decoupling for their design application.
