

## INPUT/OUTPUT FULL-SWING TINY SINGLE C-MOS OPERATIONAL AMPLIFIER

### ■GENERAL DESCRIPTION

The **NJU7042** is a single C-MOS operational amplifier permitting input and output in full swing.

The operating voltage is 2.7V to 5.5V and the input and output stage permits signal to swing between both of the supply rails.

The input offset voltage is lower than 5mV, and the input bias current is as low as than 1pA, consequently very small signal around the ground level can be amplified.

Furthermore, The **NJU7042** is packaged with very small MTP-5, therefore it can be especially applied to portable items.

PARAMETER	SYMBOL	RATING	UNIT	(Ta=25°C)
Supply Voltage	V <sub>DD</sub>	7.0	V	
Differential Input Voltage	V <sub>ID</sub>	±7.0 (Note1)	V	
Common Mode Input Voltage	V <sub>IC</sub>	-0.3~7.0	V

Note1) If the supply voltage (V<sub>DD</sub>) is less than 7.0V, the input voltage must not over the V<sub>DD</sub> level though 7.0V is limit specified.

Note2) Decoupling capacitor should be connected between V<sub>DD</sub> and V<sub>SS</sub> due to the stabilized operation for the circuit.
