

NJU6580

## BIT MAP LCD DRIVER

### ■ GENERAL DESCRIPTION

The NJU6580 is a bit map LCD driver to display graphics or characters.

It contains 1,904 bits display data RAM, microprocessor interface circuits, instruction decoder, 96-segment and 17-common(1 out of 17-driver is prepared for Icon display)drivers.

The bit image display data is transferred to the display data RAM by serial or 8-bit parallel mode.

The NJU6580 automatically performs 7 or 15 dots horizontal smooth scroll, therefore the horizontal character scroll is easily controlled by the MPU.

17 x 96 dot graphics or 6-character 1-line by 16 x 16 dot character with icon are displayed by NJU6580 itself.

The wide operating voltage like as 2.4V to 5.5V and low operating current are useful to apply small sized battery operated items.

### ■ PACKAGE OUTLINE

NJU6580CH

### ■ FEATURES

- Direct Correspondence between Display Data RAM and LCD Pixel
- Display Data RAM - 1,904 bits
- LCD Drivers - 16-common + 1 Icon common x 96-segment
- Direct Interface with both of 68 and 80 type MPU
- Serial Interface
- Programmable Duty Ratio ; 1/16 or 1/17 Duty
- Useful Instruction Set  
Display Data Read/Write, Display ON/OFF Cont, Inverse Display, Page Address Set, Column Address Set, Status Read, All On/Off, Icon Display, Read Modify Write, Common Driver Order Assignment, Power Saving, and Scroll ON/OFF.
- Power Supply Circuits for LCD Incorporated  
Step up Circuits, Regulator, Voltage Follower x 4
- Electrical Variable Resistance
- Low Power Consumption
- Operating Voltage — 2.4V ~ 5.5V
- LCD Driving Voltage — 6.0V ~ 10V
- Package Outline — Bumped Chip / TCP
- C-MOS Technology

*New Japan Radio Co., Ltd.*

■ PAD LOCATION

5

Chip Center X=0um, Y=0um  
 Chip Size X=6.54mm, Y=3.54mm  
 Chip Thickness 400um ± 30um  
 Bump Size 50um x 110um  
 Bump Height 25um TYP.  
 Bump Material Au

■ : Four PADS illustrated with this mark are the alignment marks for COG.

(Terminal 147 is NC)

## ■ Functional Description

### (1) Description for each blocks

#### (1-1) Busy Flag (BF)

When the internal circuits are in the operation mode, the busy flag(BF) is "1", and any instruction except the status read are inhibited.

The busy flag output from D<sub>7</sub> terminal when status read instruction is executed.

If enough cycle time over than t<sub>CYC</sub> indicated in the bus timing characteristics is kept, no need to check the busy flag and it realized high performance for the MPU.

#### (1-2) Line Counter

The Line Counter is reset at the FR signal changing and counts up by synchronizing common signal cycle and generate the line address which addressing the read out line of Display Data RAM.

#### (1-3) Column Address Counter

The column address counter is 8-bit presettable counter which addressing the column address as shown in Fig. 1. This counter increments (+1) up to (A0)<sub>H</sub> when the Display Data Read/Write instruction is executed. This counter auto-increments (+1) up to (A0)<sub>H</sub> but accessing to the display data RAM over than (6F)<sub>H</sub> is forbidden.

Furthermore, this counter is independent with the Page Register.

By the Address Inverse Instruction, the column address decoder inverse the column address of Display Data RAM correspondence to the Segment Driver.

#### (1-4) Page Register

This register gives page address of Display Data RAM as shown Fig. 1. When the MPU access the data by changing the page, the page address set instruction is required. Page address "2"(D<sub>1</sub>="H" and D<sub>0</sub>="L") is Icon RAM area, the data only for the D<sub>0</sub> is valid.

#### (1-5) Display Data RAM

Display Data RAM consists of 1,904 bits stores the bit image display data (each bit correspond to the each pixel so called bit map method). The each bit in the Display Data RAM correspond to the each dot of the LCD panel and control the display by following bit data.

When Normal Display : On="1" , Off="0"

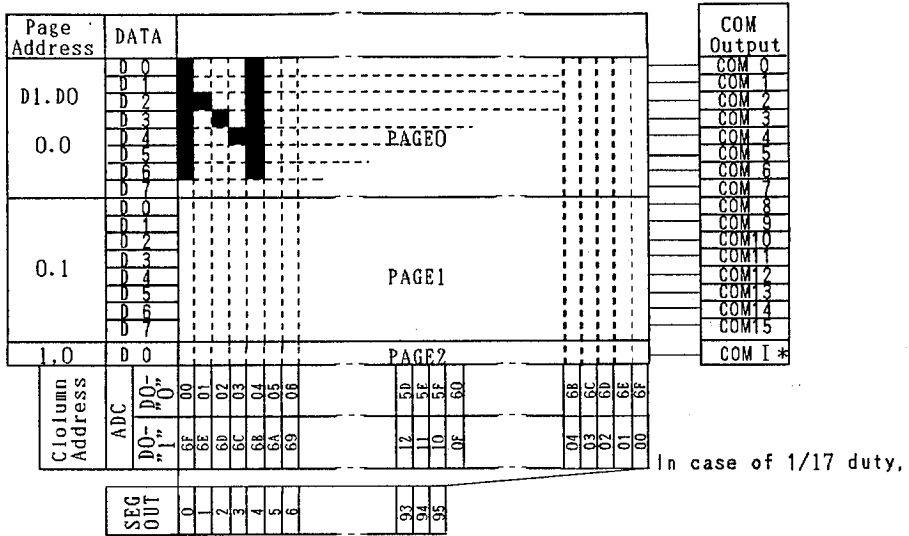

When Inverse Display : On="0" , Off="1"

The Display Data RAM output 112-bit parallel data addressed by the line counter, and these data are set in to the Display Data Latch.

This RAM and MPU are operating independently, therefore, there is no influence by the unsynchronize rewriting.

The relation between column address and segment output can inverse by the Address Inverse Instruction ADC as shown in Fig. 1.

Correspondence with Display Data RAM and Address  
(COM I can be used in case of 1/17 Duty Set)

**5**

Correspondence with column address and LCD output

(When the "On" states, the relation between column address and LCD outputs are shifting)

- No Scroll (same as scroll "Off" state)

- 15 bits scroll

Fig. 1

## (1-6) Common and Segment Driver Assignment

The scanning order can be assigned by setting A3 of the Output Assignment Register as shown Table 1. The location of Segment Drivers are fixed at any time.

Table 1

Register	Common Output Terminals				
A3	PAD No.	38	31	142	135
	Pin name	C <sub>7</sub>	C <sub>0</sub>	C <sub>8</sub>	C <sub>15</sub>
0	→	COM <sub>7</sub>	←----- COM <sub>0</sub>	COM <sub>8</sub>	-----> COM <sub>15</sub>
1	→	COM <sub>8</sub>	-----> COM <sub>15</sub>	COM <sub>7</sub>	←----- COM <sub>0</sub>

The Icon display is regardless with this function, therefore the Icon Display instruction must be executed when the Icon display is needed. In this time, the Icon display driver COM1 is fixed to COM<sub>15</sub> timing regardless the other Common Driver assignment.

## (1-7) Reset Circuits

The NJU6580 performs following initialization when the  $\overline{\text{RES}}$  input is put on the "L" level.

## Initialization

- ① Display Off
- ② Normal Display(Non-inverse display)
- ③ Icon Display Reset
- ④ ADC Select : Normal (ADC Instruction D<sub>0</sub> = "0")
- ⑤ Read Modify Write Mode Off
- ⑥ Internal Power supply(Step up) circuits Off
- ⑦ Clear the serial interface register
- ⑧ Set the address (00)<sub>H</sub> to the Column Address Counter
- ⑨ Set the page "0" to the Page Address Register
- ⑩ Select the D<sub>0</sub> of the Output Assignment register to "0"
- ⑪ Set the EVR register to (00)<sub>H</sub>
- ⑫ Scroll Off
- ⑬ Set the 8x8bit Mode to the Scroll, Set the speed 4 to the Scroll speed.
- ⑭ Release the All page to the Scroll page.

The  $\overline{\text{RES}}$  terminal connect to the Reset terminal of MPU to reset at same time as shown in "MPU Interface Example". The reset signal require over than 10us  $\overline{\text{RES}}="L"$  level input as shown in "Electrical Characteristics".

After 1us from the rise edge of  $\overline{\text{RES}}$  signal, the normal operation is starting.

In case of the internal power supply(Step up) circuits do not use, the  $\overline{\text{RES}}$  terminal must be "L" when external power supply turn on.  $\overline{\text{RES}}="L"$  input reset internal register and set above default, but oscillation circuits and output terminals like as D<sub>0</sub> through D<sub>7</sub> are no influence.

No initialization by  $\overline{\text{RES}}$  when power turns on, will make Hung up condition, therefore please initialize by the  $\overline{\text{RES}}$  when power turns on. By the reset Instruction performs only ⑧ through ⑪, ⑬, ⑭ mentioned in above.

The noise into the  $\overline{\text{RES}}$  terminal should be cared when of the application design to avoid the error function.

(1-8) LCD Driving

(a) LCD Driving Circuits

NJU6580 incorporate 113 LCD Drivers like as 96 Segment drivers, 16 Common drivers and 1 Icon common driver. Common drivers incorporate the shift register which scanning the common display signal. The combination among the Display data, COM scan signal and FR signal define the LCD driving output voltage. The output wave form is mentioned in the Fig. 8.

(b) Line Data Latch Circuits

Line Data Latch stores 112-bit of one line display data for each common cycle which read out from the Display Data RAM temporary and transfer this data to the LCD Driver. The Line Data Latch Circuits latches COMn+1 data at COMn timing to performs smooth data shifting. ( Fig. 2 )

The Display On/Off and Static Drive On/Off controls the latched data only, therefore, the data in the Display Data RAM is no change and keep on remaining.

(c) Line Counter and Latch signal of Latch Circuits

The clock for Line Counter and latch signal for the Latch Circuits are generated from display clock. The line address is renewed by synchronizing with display clock and 112 bits display data are latched into display latch circuits synchronizing with display clock then output to the LCD driving circuits. The display data transfer to the LCD driving circuits is executed independently with RAM access by the MPU.

(d) Line Data Shift Circuits

When the scroll "On" state the Line Data Shift Circuits shift maximum 15 bits toward the SEG<sub>0</sub> which input the line data from Line Data Latch Circuits, then output to Display Data Latch Circuits. In case of scroll "Off" state, the data input to the Line Data Shift Circuits output to the Display Data Latch without shift.

(e) Display Data Latch Circuits

The Display Data Latch Circuits temporarily stores 96 bits display data (which) shift 0 to 15 bits by the Line Data Shift Circuits and output to the segment drivers.

Output RAM Data to Segment

< Data Format >

< Timing >

Fig. 2

(f) Display Timing Generator

This Generator generates the timing signal for the display system by combination of the master clock and Driving Signal FR. The Frame Signal FR has a function to generate the 2 frame alternative driving method waveform for the LCD panel.

(g) Common Timing Generation

The common timing is generated by display clock.

## • Waveform of Display Timing

Fig. 3

## (h) Fundamental Clock

The Fundamental Clock is input the CLI terminal to external. It is used as display timing signal source and the clock for step up circuits for LCD driving. The fundamental clocks output frequency is divided by 384 which is used as display clock CL.

## (i) Power Supply Circuits

Internal Power Supply Circuits generate the High voltage and Bias voltage which required by the LCD. The power Supply Circuits consist of Step up (Tripler or Doubler) Circuits, Regulation Circuits, and Voltage Follower. Though the internal Power Supply designed for small size LCD panel, therefore it will not use for the large size LCD panel application. If the contrast is no good in those application, please use external power supply supplied more high current.

The suitable values of the capacitors connecting to the V1 to V5 terminals and the step up circuit, the feedback resistors for V5 operational amplifier depend on the LCD panel. And the power consumption in the LCD panel is changeable with the display pattern. Therefore a trial with actual module should be practiced.

The operation of internal Power Supply Circuits is controlled by the Internal Power Supply On/Off Instruction.

When the Internal Power Supply Off Instruction is executed, all of the step up circuits, regulation circuits, voltage follower circuits are off. In this time, the bias voltage of V1, V2, V3, V4, and V5 for the LCD supply from outside, terminals C1+, C1-, C2+, C2-, and VR are open. The status of internal power supply can select by T1 and T2 terminal. The external power supply can be used together with some of internal power supply function.

Table 3.

(\*:Don't Care)

T <sub>1</sub>	T <sub>2</sub>	Step up	Voltage Adj.	Buffer (V/F)	Ext. Pow Supply	C1+,C1-,C2+,C2-	VR Term.
L	*	○	○	○	-		
H	L	×	○	○	V <sub>OUT</sub>	OPEN	
H	H	×	×	○	V <sub>S</sub> , V <sub>OUT</sub>	OPEN	OPEN

When (T<sub>1</sub>, T<sub>2</sub>)=(H, L), the terminal for step up circuits of C1+, C1-, C2+, C2- are open due to the step up circuits doesn't work and supply the LCD driving voltage to the V<sub>OUT</sub> terminal from outside. And in case of (T<sub>1</sub>, T<sub>2</sub>)=(H, H), terminals for step up circuits and VR are open, and supply the LCD driving voltage from outside due to the Step up circuits and Voltage adjust circuits are stop its operation.

## ○ Power Supply applications

(1) External power supply operation.

(2) Internal power supply operation.

(Voltage Booster, Voltage Adj., Buffer(V/F))

Internal power supply ON (instruction) (T1,T2)=(L,L)

(3) External power supply operation with Voltage Adjustment, Buffer(V/F)

Internal power supply ON (Instruction) (T1,T2) = (H,L)

(4) External power supply operation adjusted Voltage to V5.

Internal power supply ON (Instruction) (T1,T2) =(H,H)

\* ⊗ : These switches should be open during the power save mode.

## (2) Instruction

The NJU6580 distinguish the signal on the data bus by combination of A0,  $\overline{RD}$  and  $\overline{WR}$ . Normally, the busy check is not required as the NJU6580 is operating so first because of the decode of the instruction and execution are performed only depend on the internal timing which not depend on the external clock. In case of serial interface, the data input as MSB first serially.

The Table. 3 shows the instruction codes of the NJU6580.

Table 3. Instruction Code

Instruction	Code											Description	
	A0	$\overline{RD}$	$\overline{WR}$	D <sub>7</sub>	D <sub>6</sub>	D <sub>5</sub>	D <sub>4</sub>	D <sub>3</sub>	D <sub>2</sub>	D <sub>1</sub>	D <sub>0</sub>		
(1) Display ON/OFF	0	1	0	1	0	1	0	1	1	1	0	1	LCD Display ON/OFF 0:OFF 1:ON
(2) Page Address Set	0	1	0	1	0	1	1	*	*	Page Add.		Set the page of DD RAM to the Page Add. Register	
(3) Column Address Set High Order 4bit	0	1	0	0	0	0	1	High Order Column Add.			Set the Higher order 4 bits Column Address to the Reg.		
(4) Column Address Set Lower Order 4bit	0	1	0	0	0	0	0	Lower order Column Add.			Set the Lower order 4 bits Column Address to the Reg.		
(5) Status Read	0	0	1	Status				0	0	0	0	Read out the internal Status	
(6) Write Display Data	1	1	0	Write Data								Write the data into the Display Data RAM	
(7) Read Display Data	1	0	1	Read Data								Read the Data from the Display Data RAM	
(8) ADC Select	0	1	0	1	0	1	0	0	0	0	0	1	Set the DD RAM vs Segment 0:Normal 1:Inverse
(9) Normal or Inverse of On/Off Set	0	1	0	1	0	1	0	0	1	1	0	1	Inverse the On and Off Display 0:Normal 1:Inverse
(10) Whole Display On	0	1	0	1	0	1	0	0	1	0	0	1	Whole Display Turns On 0:Normal 1:Whole Disp. On
(11) Icon Display	0	1	0	1	0	1	0	1	0	1	0	1	Set the Duty Ratio 0:No Icon 1:With Icon
(12) Read Modify Write	0	1	0	1	1	1	0	0	0	0	0	0	Increment the Column Add. Register when writing but no-change when reading
(13) End	0	1	0	1	1	1	0	1	1	1	0	0	Release from the Read Modify Write Mode
(14) Reset	0	1	0	1	1	1	0	0	0	1	0	0	Initialize the internal Circuits
(15) ComOutput / Scroll Set Up	0	1	0	1	1	0	0	A3	M	S1	S0	0	Set the COM (A3) and Scroll (M,S0,S1)
(16) Internal Power Supply On/Off	0	1	0	0	0	1	0	0	1	0	0	1	0:Int. Power Supply Off 1:Int. Power Supply On
(17) LCD Driving Voltage Set	0	1	0	1	1	1	0	1	1	0	0	1	Set LCD Driving Voltage after the internal(external) power supply is turn on
(18) EVR Register Set	0	1	0	1	0	0	Setting Data					Set the V <sub>s</sub> output level to the EVR register	
(19) Power Save (Dual Command)	0	1	0	1	0	1	0	1	1	1	0	0	Set the Power save Mode
(20) Scroll Page Set	0	1	0	0	1	*	*	*	*	P1	P0	0	Set the Scroll Page P*=0:Used Scroll P*=1:No Scroll
(21) Scroll On / Off Set	0	1	0	1	0	1	0	1	0	0	0	1	Scroll ON/OFF 0:OFF 1:ON
(22) Data Request Reset	0	1	0	0	0	1	0	0	0	0	0	0	Reset the Data Request Signal

(\*:Don't Care)

### (3) Explanation of Instruction Code

#### (a) Display On/Off

This instruction executes whole display On/Off no relation with the data in the Display Data RAM and internal conditions.

	A <sub>0</sub>	$\overline{\text{RD}}$	$\overline{\text{WR}}$	$\overline{\text{D}_7}$							$\overline{\text{D}_0}$
	0	1	0	1	0	1	0	1	1	1	D

D 0: Display Off  
1: Display On

#### (b) Page Address Set

When MPU access the Display Data RAM, the page address corresponded to the row address must be selected. The access in the Display Data RAM is available by setting the page and column address(Refer the Fig. 1.). The display is no influence by changing the page addressed. Page 2 is a Icon display data area which available only for the D<sub>0</sub>.

	A <sub>0</sub>	$\overline{\text{RD}}$	$\overline{\text{WR}}$	$\overline{\text{D}_7}$							$\overline{\text{D}_0}$
	0	1	0	1	0	1	1	*	*	A <sub>1</sub>	A <sub>0</sub>

(\*:Don't Care)

A <sub>1</sub>	A <sub>0</sub>	Page
0	0	0
0	1	1
1	0	2

#### (c) Column Address

When MPU access the Display Data RAM, page address set(refer(b) in front page) and column address set are required before the data writing. The column address set performs twice address setting of higher order 4 bits and lower order 4 bits. When the MPU access the Display Data RAM continuously, the column address increase "1" automatically, therefore, the MPU can access the data only without address setting.

This counter auto-increment up to (A0)<sub>H</sub>, but accessing to the display data RAM over than (6F)<sub>H</sub> is forbidden.

After writing 1 page data, page address setting is required due to page address doesn't increase automatically.

	A <sub>0</sub>	$\overline{\text{RD}}$	$\overline{\text{WR}}$	$\overline{\text{D}_7}$							$\overline{\text{D}_0}$
Higher Order	0	1	0	0	0	0	1	A <sub>7</sub>	A <sub>6</sub>	A <sub>5</sub>	A <sub>4</sub>
Lower Order	0	1	0	0	0	0	0	A <sub>3</sub>	A <sub>2</sub>	A <sub>1</sub>	A <sub>0</sub>

A <sub>7</sub>	A <sub>6</sub>	A <sub>5</sub>	A <sub>4</sub>	A <sub>3</sub>	A <sub>2</sub>	A <sub>1</sub>	A <sub>0</sub>	Column Address
0	0	0	0	0	0	0	0	00
0	0	0	0	0	0	0	1	01
								⋮
0	1	1	0	1	1	1	1	6F

**(d) Status Read**

This instruction read out the internal status of "BUSY", "ADC", "ON/OFF" and "RESET".

A0	$\overline{RD}$	$\overline{WR}$	D <sub>7</sub> _____ D <sub>0</sub>							
0	0	1	BUSY	ADC	ON/OFF	RESET	0	0	0	0

**BUSY** : BUSY=1 indicate the operating or the Reset cycle.  
The instruction can be input after the BUSY status change to "0".

**ADC** : Indicate the output correspondence of column(segment) address and segment driver.  
 0 : Counterclockwise Output(Inverse) Column Address 95-n  $\longleftrightarrow$  Segment Driver n  
 1 : Clockwise Output (Normal) Column Address n  $\longleftrightarrow$  Segment Driver n  
 (Note) The data "0=Inverse" and "1=Normal" of ADC is inverted with the ADC select Instruction of "1=Inverse" and "0=Normal".

**ON/OFF** : Indicate the whole display On/Off status.  
 0 : Whole Display "On"  
 1 : Whole Display "Off"  
 (Note) The data "0=On" and "1=Off" of Display On/Off status read out is inverted with the Display On/Off instruction data of "1=On" and "0=Off".

**RESET** : Indicate the initialization period by  $\overline{RES}$  signal or reset instruction.  
 0 : —  
 1 : Initialization Period

**(e) Write Display Data**

This instruction write the 8-bit data on the data bus into the Display Data RAM. The column address increase "1" automatically when writing, therefore, the MPU can write the 8-bit data into the Display Data RAM without any address setting after the start address setting.

A0	$\overline{RD}$	$\overline{WR}$	D <sub>7</sub> _____ D <sub>0</sub>							
1	1	0	WRITE DATA							

**(f) Read Display Data**

This instruction read out the 8-bit data from Display Data RAM which addressed by the column and page address. The column address increase "1" automatically when reading, therefore, the MPU can read the 8-bit data from the Display Data RAM without any address setting after the start address setting. One time of dummy read is required after column address set as explain in "(5-5) Access to the Display Data RAM and Internal Register". In the serial interface mode, the display data can not be readout.

A0	$\overline{RD}$	$\overline{WR}$	D <sub>7</sub> _____ D <sub>0</sub>							
1	0	1	READ DATA							

(g) ADC Select

This instruction set the correspondence of column address in the Display Data RAM and segment driver output. (See Fig. 1.) By this instruction, the order of segment output can be changed by the software, and no restriction of the LSI placement against the LCD panel.

A0	$\overline{RD}$	$\overline{WR}$	$D_7$							$D_0$
0	1	0	1	0	1	0	0	0	0	D

D 0: Clockwise Output (Normal)  
 1: Counterclockwise Output (Inverse)

(h) Normal or Inverse On/Off Set

This instruction set the normal or inverse turn on and turn off for whole display. The contents of Display Data RAM is no changed by this instruction execution.

A0	$\overline{RD}$	$\overline{WR}$	$D_7$							$D_0$
0	1	0	1	0	1	0	0	1	1	D

D 0: Normal RAM data "1" correspond to "On"  
 1: Inverse RAM data "0" correspond to "On"

(i) Whole Display On

This instruction executes the all pixel turns on regardless the contents of the Display Data RAM. In this time, the contents of Display Data RAM is no change and is kept. This instruction takes over precedence over the "Normal or Inverse On/Off Set Instruction".

A0	$\overline{RD}$	$\overline{WR}$	$D_7$							$D_0$
0	1	0	1	0	1	0	0	1	0	D

D 0: Normal Display  
 1: Whole Display turns on

When Whole Display On Instruction is executed in the Display Off status, the internal circuits put on the power save mode(refer to the (s) Power Save).

(j) Icon Display

This instruction set the 1/17 duty for the Icon Display. The COM1 terminal operate as COM<sub>16</sub> and output the icon display data stored in  $D_0$  of Display Data RAM page 2(refer to the Fig. 1).

A0	$\overline{RD}$	$\overline{WR}$	$D_7$							$D_0$
0	1	0	1	0	1	0	1	0	1	D

D 0: 1/16 Duty  
 1: 1/17 Duty

## (k) Read Modify Write

This instruction set the Read Modify Write Mode which performs the column address increment. During the Read Modify Mode, the column address increase "1" automatically when the Display Data Write Instruction is executed, but the address is no change when the Display Data Read Instruction is executed. This status is continued during End instruction execution. When the End instruction is entered the column address back to the address where the Read Modify Write instruction entering. By this function, the load of MPU for example cyclic data writing operation like as cursor blink etc., can be reduced.

A0	$\overline{\text{RD}}$	$\overline{\text{WR}}$	D <sub>7</sub>								D <sub>0</sub>
0	1	0	1	1	1	0	0	0	0	0	0

Note) During the Read Modify Write mode, any instruction except Column Address Set can be executed.

## (l) Sequence of cursor display

(m) End

This instruction release the Read Modify Write mode and the column address back to the address where the read modify write mode setting.

(n) Reset

This instruction executes the following initialization.

Initialization

- ① Set the Address (00)<sub>H</sub> to the Column Address Counter.
- ② Set the page "0" to the Page Address Register.
- ③ Select the D<sub>0</sub> of the Output Assignment register to "0"
- ④ Set the EVR register to (00)<sub>H</sub>
- ⑤ Set the 8x8bit Mode to the Scroll ,Set the speed 4 to the Scroll speed.
- ⑥ Release the All page to the Scroll page.

In this time, there are no influence to the Display Data RAM.

The reset signal input to the  $\overline{RES}$  terminal must be required for the initialization when the power turns on. Substitution of Reset Instruction for the reset signal input to the  $\overline{RES}$  terminal is not allowed.

**5**

(o) COM Output / Scroll Set Up

This instruction set the Common Driver scanning order and Scroll states.

A<sub>3</sub> : Set the Common Driver scanning order. (Refer to 1-6)

M : Set the Scroll Dot of 1-Characters

0 : 8x8 Dot Mode

1 : 16x16 Dot Mode

S0,S1 : Set the Scroll Speed in 4-step

	Scroll Speed	S1	S0	
fast ↑	4	0	0	..... 32.6 dot/sec
	3	0	1	..... 16.3 dot/sec
	2	1	0	..... 8.1 dot/sec
slow ↓	1	1	1	..... 4.1 dot/sec

<CL1=400kHz, 1/16Duty>

(p) Internal Power Supply

This instruction set the internal Power Supply On/Off. Step up circuits, Voltage Regulator and Voltage Follower are activated when set the On. To operate the step up circuits, the operation of oscillation circuits is required.

D 0: Internal Power Supply Off

1: Internal Power Supply On

The internal Power Supply must be Off when external power supply using.

(q) LCD Driving Voltage Set

This instruction sets LCD driving voltage V1 ~ V4 and output LCD driving waveform through the COM/SEG terminals.

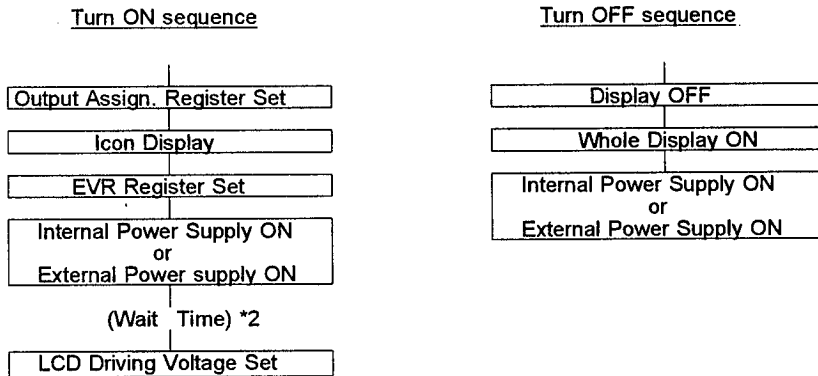

A0	$\overline{RD}$	$\overline{WR}$	D <sub>7</sub> ~ D <sub>0</sub>							
0	1	0	1	1	1	0	1	1	0	1

NJU6580 contains operational amplifiers for LCD bias voltage V1 ~ V4. These amplifiers current are reduced in order to realize low power consumption. Because of this reduction, LCD driving voltage V1 ~ V4 might be unstable just after the internal power supply is turned on. LCD Driving Voltage Set instruction is prepared for this unstableness.

● LCD driving power supply ON/OFF sequences

The following sequences are required when the power supply is tuned on/of.

When the power supply is tuned on again after the turn off (by the power save instruction), the power save release sequence mentioned in (s) is required.

\*1 This instruction is required in both cases of the internal and external power supply.

Until "LCD driving voltage Set" execution, NJU6580 operating current is higher than usual state and all COM/SEG terminals output V<sub>DD</sub> level continuously except LCD driving waveform.

\*2 The wait time depends on the C<sub>3</sub> ~ C<sub>7</sub>, C<sub>OUT</sub> capacitors((4) (d)Fig.5), V<sub>DD</sub> and V<sub>LCD</sub> voltage. Therefore a test on actual module should be practiced. Refer to the following graph.

(r) EVR Register Set

This instruction set the LCD Display contrast which is controlled by the voltage adjust circuits. When this instruction execute, the internal Electrical Variable Resistor(EVR) to change the  $V_s$  output voltage, generate one voltage from 32 voltage state. The range of  $V_s$  output level can be adjusted by the external resistance. For more detail, please refer to the "(4)(b) Voltage Adjust Circuits".

A <sub>4</sub>	A <sub>3</sub>	A <sub>2</sub>	A <sub>1</sub>	A <sub>0</sub>	V <sub>LCD</sub>
0	0	0	0	0	Low
:	:	:	:	:	
1	1	1	1	1	High

$$V_{LCD} = V_{DD} - V_s$$

When EVR doesn't use, set the EVR register to (0,0,0,0,0).

(s) Power Save(Dual Command)

When both of Display Off and Whole Display On are executed, the internal circuits put on the power save mode and the operating current is reduced as same as stand by current.

The internal status in the Power Save Mode is as follows;

- ① Stop the Oscillation Circuits and Internal Power Supply Circuits operation.
- ② Stop the LCD driving. Segment and Common drivers output  $V_{DD}$  level.
- ③ Keeping the display data and operating mode as before the power save mode.
- ④ All of LCD driving bias voltage fixed to the  $V_{DD}$  level.

The power save and its release should be performed according to the following sequences.

Power Save Sequence

Power Save Release Sequence

\*1 Power save mode requires dual-instruction. After the second instruction" whole Display ON", the power save mode starts.

\*2 In the power save release sequence, the Display ON instruction should be performed after the Normal Display instruction. The power save mode is released after the Normal Display instruction.

\*3 Until "LCD driving voltage set" execution, NJU6580 operating current is higher than usual state and all COM/SEG terminals output  $V_{DD}$  level continuously except the LCD driving waveform.

\*4 In case of external bleeder resistors, cut current on these resistors electrically and fix them to  $V_{DD}$  or float them before the power save mode or at the same time. At this time  $V_{OUT}$  terminal should be floated or connected to the lowest voltage level of the system.

\*5 In case of the external power supply, it should be turned off before the power save mode or at the same time, and  $V_{OUT}$  terminal should be floated or connected to the lowest voltage of the system.

5

(t) Scroll Page Set

This instruction sets some Scroll Pages at the same time.

In case of 16x16 dots scroll mode, P<sub>3</sub> to P<sub>0</sub> data must be set from the following table.

(u) Scroll On/Off

This instruction sets the horizontal scroll On/Off.

When this instruction execute, the scroll performs under the condition set by both of COM Output, Scroll Set Up and Scroll Page Set instruction. When stop the scroll by this instruction, the scroll is not stopped immediately but after 7 dots (8x8 dots mode) or 15 dots (16x16 dots mode) shift performs completely.

(v) Data Request Reset

One character shift performs completely during the scroll operation, the DREQ terminal output the Data Request signal to the MPU. After rewrite the display data in the RAM, reset the DREQ terminal by this instructions required.

The timing of Data Request signal set is :

- In case of 16x16 dot mode : timing of COM<sub>14</sub>
- In case of 8x8 dot mode : timing of COM<sub>0</sub>, COM<sub>14</sub>

## (4) Internal Power Supply

### (a) Voltage tripler

Three times negative voltage ( $V_{DD}$  common) of the voltage  $V_{DD} - V_{SS}$  is output from  $V_{OUT}$  terminal when connecting three capacitor between  $C1^+$  and  $C1^-$ ,  $C2^+$  and  $C2^-$ ,  $V_{SS}$  and  $V_{OUT}$ . In case of the voltage doubler operation, connect the two capacitor between  $C2^+$  and  $C2^-$ ,  $V_{SS}$  and  $V_{OUT}$ , then connect the  $C1^+$  and  $C2^+$  terminals. Step up circuits like as Voltage Tripler or Doubler using an oscillation circuit's output as its clock signal, therefore, the oscillation circuit's operation is required when step up operation. The voltage relation regarding the step up circuits is shown in below. When voltage tripler operation, the operation voltage  $V_{DD}$  should be less than 3.3V.

### (b) Voltage Adjust Circuits

The step up voltage of  $V_{OUT}$  output from  $V_S$  through the voltage adjust circuits. The output voltage of  $V_S$  is adjusted by changing the  $R_a$  and  $R_b$  within the range of  $|V_S| < |V_{OUT}|$ . The output voltage can be calculated by the following formula.

$$V_S = V_{DD} - (1 + R_b/R_a) \cdot V_{REG} \quad \text{①}$$

Fig. 4

Where, the  $V_{REG}$  is a constant voltage in the NJU6580 like as  $V_{REG} \doteq 2.5V$ .

To adjust the output voltage from  $V_S$ , connect the variable resistance among  $VR$ ,  $V_{DD}$  and  $V_S$  as shown in Fig. 4. When fine tuning for  $V_S$  is needed, combine with the fixed resistance of  $R_1$ ,  $R_3$  and variable resistance of  $R_2$  is recommended as shown in Fig. 4.

#### Design example for $R_1$ , $R_2$ and $R_3$ (reference)

- $R_1 + R_2 + R_3 = 5M \Omega$  (Determined by the current flow between  $V_{DD} - V_S$ )
- Variable voltage range by the  $R_2$ .  $-4V \sim -6V$  ( $V_{DD} - V_S \rightarrow 7V \sim 9V$ )  
(Determined by the LCD electrical characteristics)

$R_1$ ,  $R_2$  and  $R_3$  are calculated by above conditions and the formula of ① to mentioned below;

$$R_1 = 1.389M \Omega$$

$$R_2 = 0.397M \Omega$$

$$R_3 = 3.214M \Omega$$

The voltage adjust circuit has a temperature coefficient against the  $V_{REG}$  output. If necessary, please connect the thermistor to the voltage adjust circuit serially.

To avoid the noise trouble, short wiring or sealed wiring is required for  $VR$  terminal input due to the  $VR$  terminal is high impedance.

(c) Contrast Adjustment by using the EVR function

To use EVR function, the LCD driving voltage of  $V_s$  which controls LCD display contrast can adjust by the instruction. The EVR function is executed to set the 5 bits data into the EVR resistor and determine the one output voltage status out of 32 prefixed voltage status.

When execute the EVR function, set the  $T_1$  and  $T_2$  except the "H, H" and execute the Internal Power Supply On instruction.

[ External parts constants setting example when EVR function using/reference ]

(1) Determine the  $V_s$  voltage range controlled by EVR.

LCD Driving Voltage  $V_{DD} - V_s$        $6V \sim 9V$   
 The range of  $V_s$        $3V$

(2) Determine the  $R_b$ .

$R_b = [\text{The range of } V_s] / I_{REF}$       ( 32 status  $I_{REF} \doteq 5 \mu A$  constant current )  
 $R_b = 3V / 5 \mu A = 600k \Omega$       \* $T_a = 25^\circ C$      $V_{DD} - V_{OUT} = 9V$

(3) Adjust the  $R_a$

$$R_a = \frac{V_{REG}}{([\text{LCD Driving Voltage}] - V_{REG}) / R_b}$$

$$R_a = \frac{2.5 V}{(6V - 2.5V) / 600k \Omega} = 428.6k \Omega$$

(4) Adjust the  $R_a$

Adjust the  $R_a$  to good contrast of LCD display after the ( $D_4, D_3, D_2, D_1, D_0$ ) of EVR register set to (1, 0, 0, 0, 0) or (0, 1, 1, 1, 1). When the EVR using,  $R_a$  use a variable resistance and contrast adjustment mentioned in (4) for each chip is required due to the  $I_{REF}$  is simple constant current source.

When the EVR function does not use, the ( $D_4, D_3, D_2, D_1, D_0$ ) of EVR register set to (0, 0, 0, 0, 0) by the RES signal or the EVR Register Set instruction.

\*)  $V_{REG}$ ,  $I_{REF}$  depends on the voltage between  $V_{DD}$  and  $V_{OUT}$ , the operating temperature. Please refer to the following graphs.

VREG vs. Temperature (Typical performance)

IREF vs. Temperature (Typical performance)

(d) LCD Driving Voltage Generation Circuits

The LCD driving bias voltage of  $V_1, V_2, V_3, V_4$  are generated internally to divide the  $V_5$  voltage by the bleeder resistance. And its supply to the LCD driving circuits after convert the impedance.

As shown in Fig. 5 capacitor are required for each LCD driving voltage terminal as a voltage stabilizing. And the value of capacitor C3 to C7 determine by combine with the actual LCD panel.

Using the internal Power Supply

Using the external Power Supply

Reference set up value  
 $V_{LCD} = V_{DD} - V_5 \approx 7 \sim 9V$

Item	Value
C1-C2	4.7~10 $\mu$ F
C3~C7	0.1~0.47 $\mu$ F
R1	1.388M $\Omega$
R2	0.388M $\Omega$
R3	3.214M $\Omega$

Fig. 5

\*1 Short wiring or sealed wiring is required for the VR terminal due to the high impedance of VR terminal.

\*2 Following connection of  $V_{OUT}$  is required when external power supply using.

When  $V_{SS} > V_5 - V_{OUT} = V_5$

When  $V_{SS} \leq V_5 - V_{OUT} = V_{SS}$

(5) MPU Interface

(5-1) Interface type selection

NJU6580 can interface by using both of 8 bit bilateral data bus ( $D_7$  to  $D_0$ ) or serial interface (SI). The 8 bit parallel or serial interface is determined the P/S terminal connected to "H" or "L" level as shown in Table 4. In case of the serial interface, status and RAM data read out is impossible.

Table 4

P/S	Type	$\overline{CS}$	A0	$\overline{RD}$	$\overline{WR}$	C86	SI	SCL	$D_0 \sim D_7$
H	Parallel	$\overline{CS}$	A0	$\overline{RD}$	$\overline{WR}$	C86	-	-	$D_0 \sim D_7$
L	Serial	$\overline{CS}$	A0	-	-	-	SI	SCL	OPEN

(5-2) Parallel Interface

The NJU6580 can interface both of 68 or 80 type MPU directly by setting the parallel interface (P/S="H") and "H" or "L" of the C86 terminal as shown in Table 5.

Table 5

C86	Type	$\overline{CS}$	A0	$\overline{RD}$	$\overline{WR}$	$D_0 \sim D_7$
H	68 type MPU	$\overline{CS}$	A0	E	R/W	$D_0 \sim D_7$
L	80 type MPU	$\overline{CS}$	A0	$\overline{RD}$	$\overline{WR}$	$D_0 \sim D_7$

(5-3) Discrimination of Data Bus Signal

The NJU6580 discriminate the signal on the data bus by the combination of A0, E, R/W, and ( $\overline{RD}$ ,  $\overline{WR}$ ) signals as shown in Table 6.

Table 6

Common	68 type		80 type		Function
	A0	R/W	$\overline{RD}$	$\overline{WR}$	
	1	1	0	1	Read Display Data
	1	0	1	0	Write Display Data
	0	1	0	1	Status Read
	0	0	1	0	Write into the Register(Instruction)

(5-4) Serial Interface.(P/S="L")

Serial interface circuits consist of 8 bits shift register and 3 bits counter. SI and SCL input are activated when the chip select terminals set to  $\overline{CS}$ ="L", and P/S terminal set to "L". The 8 bits shift register and 3 bits counter are reset to the initial condition in no chip selection period. The data input from SI terminal is MSB first like as the order of  $D_7$  to  $D_0$ , and the data is entered into the shift register synchronized at the rise edge of the serial clock SCL. The data in the shift register converted to parallel data at the 8th serial clock rise edge input. Discrimination of the display data or instruction for the serial input data is executed by the A0 input which take into the LSI at the 8th serial clock rise edge, or, A0="H" is display data and A0="L" is instruction. When RES terminal becomes "L" or CS terminal becomes "H" in spite of the data less than 8 bits, NJU6580 recognizes wrong data as a instruction data. Therefore 8bits data is required for the input data. The time chart for the serial interface is shown in Fig. 6. To avoid the noise trouble, the short wiring is required for the SCL input.

Note) The read out function, such as the status or RAM data read out, is not supported in this serial interface.

Fig. 6

(5-5) Access to the Display Data RAM and Internal Register.

The NJU6580 is operating as one of pipe-line processor by the bus-holder connecting to the internal data bus to adjust the operation frequency between MPU and the Display Data RAM or Internal Register.

For example, when the MPU read out the data from the Display Data RAM, the data read out in the data read cycle(dummy read) is held in the bus-holder at once then read out from the bus-holder to the system bus at next data read cycle. And when write the data into the Display Data RAM, the data is held in the bus-holder at once then write into the Display Data RAM by next data write cycle.

Therefore high speed data transmission between MPU and NJU6580 is available because of the limitation of access time of NJU6580 locking from MPU is just determined by the cycle time only which ignored the access time of  $t_{ACC}$  and  $t_{DS}$  of Display Data RAM. If the cycle time can not be kept in the MPU operation, NOP operation cycle which equivalent to the waiting operation is useful.

Please note that the read out data is a address data when the read out execution just after the address setting. Therefore, one dummy read is required after address setting or write cycle as shown in Fig. 7.

● Write Operation

● Read Operation

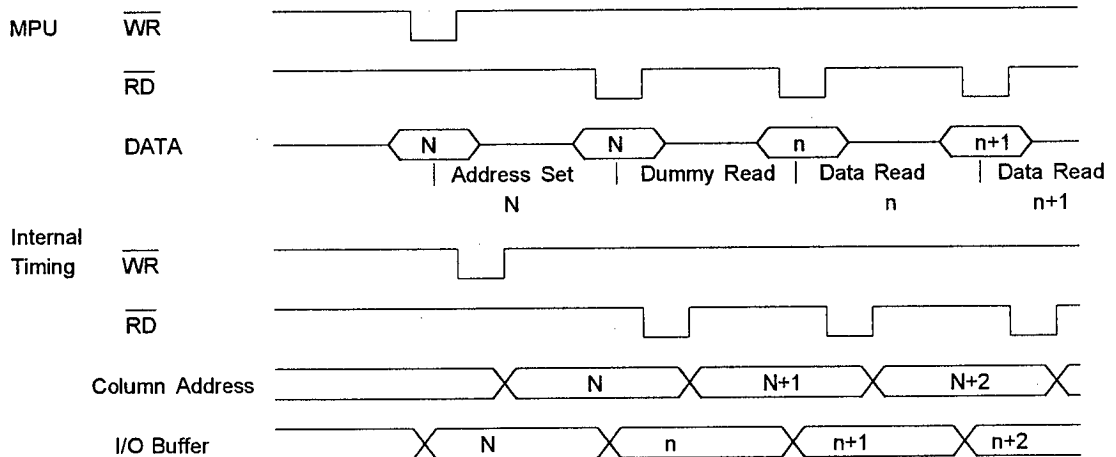

Fig. 7

(5-6) Chip Select

CS is Chip Select terminals. The Chip Select is executed by the setting of  $\overline{CS}="L"$ . Only the select mode, the interface with MPU is available. In the non select period, the  $D_0$  to  $D_7$  are high impedance and  $A_0$ ,  $\overline{RD}$ ,  $\overline{WR}$ ,  $\overline{SI}$  and  $\overline{SCL}$  input are put on the disable state. If the serial interface is selected in the non select period, the shift register and counter are reset. The reset input is regardless with the condition of  $\overline{CS}$ .

NJU6580

■ ABSOLUTE MAXIMUM RATINGS

(Ta=25 °C)

PARAMETER	SYMBOL	RATINGS	UNIT
Supply Voltage (1)	V <sub>DD</sub>	- 0.3 ~ + 7.0 - 0.3 ~ + 3.3 (used Tripler)	V
Supply Voltage (2)	V <sub>S</sub>	V <sub>DD</sub> -10.8 ~ V <sub>DD</sub> +0.3	V
Supply Voltage (3)	V <sub>1</sub> ~V <sub>4</sub>	V <sub>S</sub> ~ V <sub>DD</sub> +0.3	V
Input Voltage	V <sub>IN</sub>	- 0.3 ~ V <sub>DD</sub> +0.3	V
Operating Temperature	Topr	- 30 ~ + 80	°C
Storage Temperature	Tstg	- 55 ~ + 125 (Chip) - 55 ~ + 100 (TCP)	°C

Note 1) If the LSI are used on condition above the absolute maximum ratings, the LSI may be destroyed. Using the LSI within electrical characteristics is strongly recommended for normal operation. Use beyond the electric characteristics conditions will cause malfunction and poor reliability.

Note 2) All voltage values are specified as V<sub>SS</sub> = 0 V.

Note 3) The relation : V<sub>DD</sub> ≥ V<sub>1</sub> ≥ V<sub>2</sub> ≥ V<sub>3</sub> ≥ V<sub>4</sub> ≥ V<sub>S</sub> ; V<sub>DD</sub> > V<sub>SS</sub> ≥ V<sub>OUT</sub> must be maintained.

Note 4) Decoupling capacitor should be connected between V<sub>DD</sub> and V<sub>SS</sub> due to the stabilized operation for the Voltage converter.
