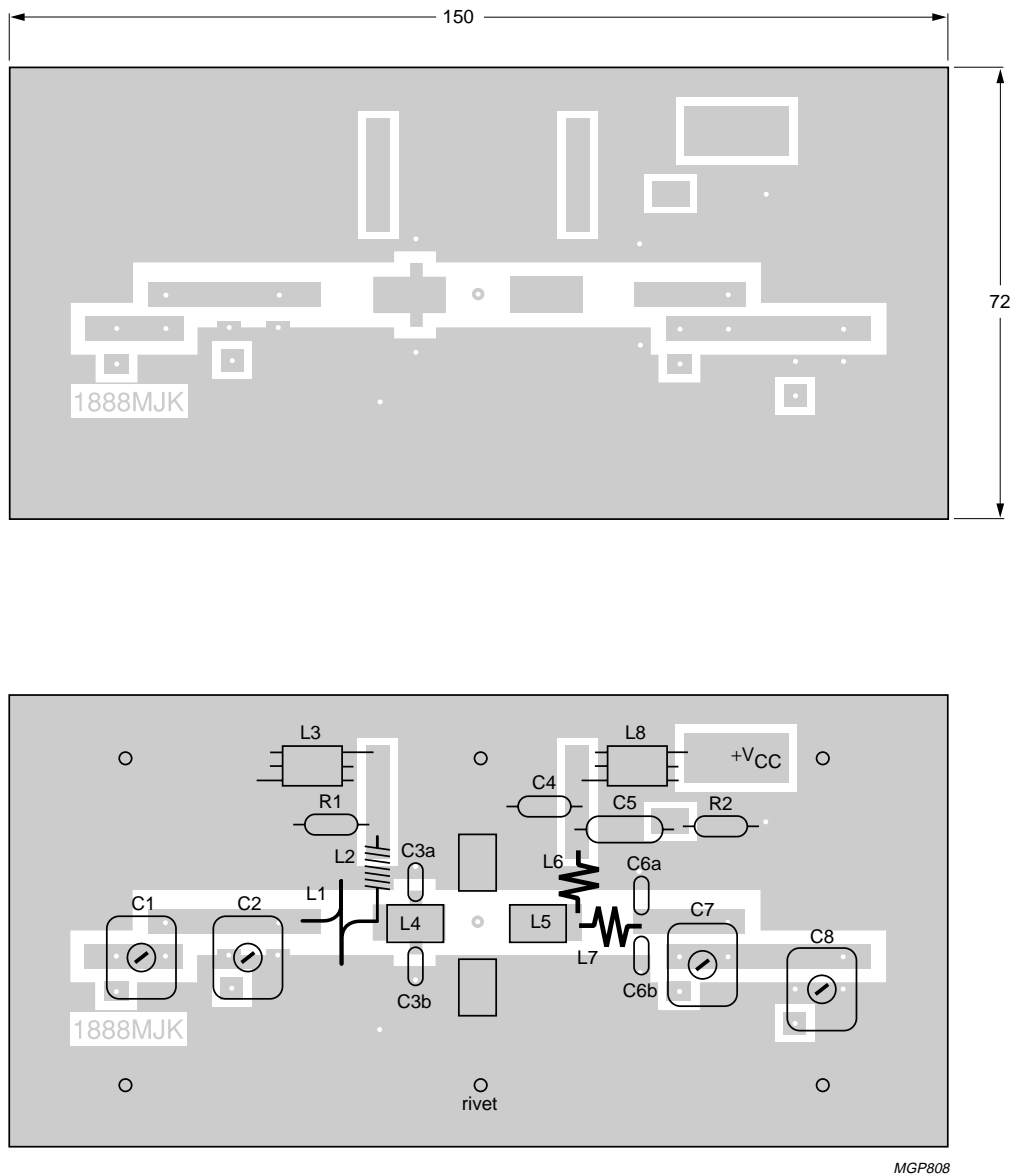

Fig.8 Component layout and printed-circuit board for 175 MHz test circuit.

The circuit and the components are situated on one side of the epoxy fibre-glass board, the other side being fully metallized to serve as earth. Earth connections are made by means of hollow rivets, whilst under the emitter leads Cu straps are used for a direct contact between upper and lower sheets.

Fig.11 R.F. soar.

Conditions for R.F. SOAR

- $f = 175$ MHz
- $T_h = 70$ °C
- $R_{th\ mb-h} = 0,45$ K/W
- $V_{CCnom} = 13,5$ V
- $P_S = P_{Snom}$ at $V_{CCnom} = 13,5$ V and $VSWR = 1$

The transistor has been developed for use with unstabilized supply voltages. As the output power and drive power increase with the supply voltage, the nominal output power must be derated in accordance with the graph for safe operation at supply voltages other than the nominal. The graph shows the permissible output power under nominal conditions ($VSWR = 1$), as a function of the expected supply over-voltage ratio with $VSWR$ as parameter.

The graph applies to the situation in which the drive (P_S/P_{Snom}) increases linearly with supply over-voltage ratio.

OPERATING NOTE

Below 50 MHz a base-emitter resistor of 10 Ω is recommended to avoid oscillation. This resistor must be effective for r.f. only.
