PIN CONFIGURATION

DESCRIPTION

This 10-bit bus switch is designed for 3 V to 3.6 V V_{CC} operation and SSTL_2 output enable (\overline{OE}) input levels.

When \overline{OE} is LOW, the 10-bit bus switch is on and port A is connected to port B. When \overline{OE} is HIGH, the switch is open, and a high-impedance state exists between the two ports.

The low on-state resistance of the switch allows connections to be made with minimal propagation delay.

The CBT3857 is characterized for operation from 0°C to +85°C.

- All typical values are at $V_{CC} = 3.3 \text{ V}$, $T_{amb} = 25^{\circ}\text{C}$
- Measured by the voltage drop between the A and the B terminals at the indicated current through the switch. On-state resistance is determined by the lowest voltage of the two (A or B) terminals.

NOTE:

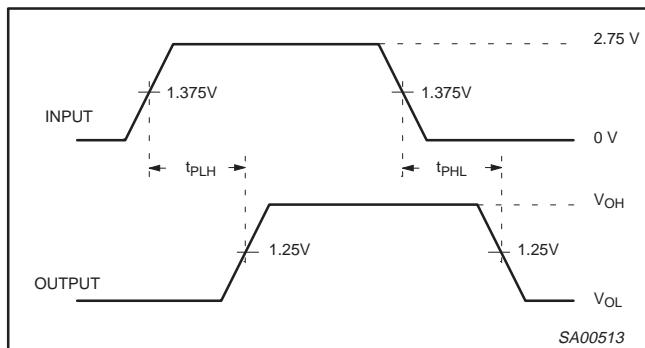

- The propagation delay is based on the RC time constant of the typical on-state resistance of the switch and a load capacitance, when driven by an ideal voltage source (zero output impedance); $24 \Omega \times 30 \text{ pF}$.
